HISTORY

Date	Changes
2002-05-17	<i>Publication of version 2.1 as draft standard</i>
2006-10-02	<i>Publication of version 3.0 as draft standard proposal</i> <ul style="list-style-type: none">- Editorial and lay-out changes have been made- Object 1000h: Additional definitions- Detailed definitions of PDO parameters have been included- Additional PDO mapping for joystick devices- Warning if analogue input global interrupt is disabled- Additional dead-band objects for joystick devices
2008-06-03	<i>Publication of version 3.0 as draft standard</i>

General information on licensing and patents

CAN in AUTOMATION (CiA) calls attention to the possibility that some of the elements of this CiA specification may be subject of patent rights. CiA shall not be responsible for identifying any or all such patent rights.

Because this specification is licensed free of charge, there is no warranty for this specification, to the extent permitted by applicable law. Except when otherwise stated in writing the copyright holder and/or other parties provide this specification "as is" without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The entire risk as to the correctness and completeness of the specification is with you. Should this specification prove failures, you assume the cost of all necessary servicing, repair or correction.

Trademarks

CANopen® and CiA® are registered community trademarks of CAN in Automation. The use is restricted for CiA members or owners of CANopen vendor ID. More detailed terms for the use are available from CiA.

1 Scope

This specification represents the CANopen device profile for generic digital and analogue input and output modules. Devices compliant to this specification use communication techniques, which conform to those described in the CANopen application layer and communication profile specification. In addition, programmable I/O devices may use communication techniques, which conform to those described in the CANopen additional application layer functions.

In the appendices, some specific I/O devices are defined.

3 Definitions and abbreviations

3.1 Definition

The definitions given in /CiA301/ and /CiA303-2/ apply for this specification, too.

3.2 Abbreviations

CAN	Controller area network
CAN-ID	CAN identifier
COB	Communication object
COB-ID	COB identifier
I/O	Input and output
PDO	Process data object
RPDO	Receive process data object
SDO	Service data object
TPDO	Transmit process data object

4 Operating principle

4.1 Introduction

The purpose of I/O modules is to connect sensors and actuators to CANopen networks. In NMT operational mode, input data are transmitted from the inputs via TPDOs. By default, the PDO transmission is triggered by an interrupt (event). Optionally PDOs are transmitted synchronously or remotely requested. In addition, it is possible to read input data via SDO communication from another module, or to write data via SDO to the network, if the module provides SDO client functionality.

Output data can be received via RPDO by those I/O modules that have output capabilities. Output data also can be received via SDO communication services.

However, the main purpose of SDO communication is to configure an I/O module. The module can receive via SDO I/O configuration data, parameters for converting data into meaningful measurements and so on. I/O modules compliant with this device profile use pre-defined

PDOs. The default mapping of application objects into TPDO respectively RPDO is changeable via SDO, if variable PDO mapping is supported. An I/O module provides optionally sync producer/consumer, time-stamp producer/consumer and emergency producer/consumer functionality. For new designs, it is recommended to support Heartbeat functionality.

4.2 Node-ID assignment

The node-ID assignment is manufacturer specific. If a node-ID assignment via CAN network is required (e.g. for IP 67-rated devices), it is recommended to use the layer setting protocols as defined in /CiA305/.

5 Error handling

5.1 Principle

Emergency messages are triggered by internal errors in the device and they are assigned the highest possible priority to ensure that they get access to the bus without latency. By default, the Emergency messages contain the error field with pre-defined error numbers and additional information.

5.2 Error behavior

If a serious device failure is detected the module shall enter by default autonomously the Pre-operational state. If 1029_h object is implemented, the device may be configured to enter alternatively the Stopped state or remain in the current state in case of a device failure. Device failures should include the following communication errors:

- Bus-off conditions of the CAN interface
- Life guarding event with the state ‘occurred’
- Heartbeat event with state ‘occurred’

Severe device errors also may be caused by device internal failures.

5.3 Analogue input disable warning

If the CANopen device transits to NMT operational state and the Analogue input global interrupt object (6423_h) is set to FALSE, it shall transmit an Emergency message with the error code 0080_h. This Emergency message shall not cause a transition into NMT pre-operational or NMT stopped state.

5.4 Additional error code definitions

Error code definitions used by this profile are given in Table 1.

Table 1 — Error code definition

Error code	Definition
0080 _h	Warning: Analogue inputs disabled
2310 _h	Current at outputs too high (overload)
2320 _h	Short circuit at outputs
2330 _h	Load dump at outputs
3110 _h	Input voltage too high
3120 _h	Input voltage too low
3210 _h	Internal voltage too high

Error code	Definition
3220 _h	Internal voltage too low
3310 _h	Output voltage too high
3320 _h	Output voltage too low

6 Pre-definitions

6.1 Introduction

If a device supports a specific type of I/O functionality (analogue/digital I/O) it shall support the related default PDOs. However, the module may support additional manufacturer-specific PDOs. If variable PDO mapping is supported the PDO default settings may be changed by means of configuration.

There may be implemented up to 4 enabled TPDOs and up to 4 enabled RPDOs with default mappings. If a module does not support a specific I/O function, the related default PDOs shall remain unused. If a device supports more than the pre-mapped digital input or output channels, the analogue default PDOs shall not be used to map digital inputs or outputs by default. The additional digital I/Os may use additional PDOs. This shall correspond to additional analogue channels.

All TPDOs with transmission type 255 shall be transmitted when entering the operational state.

6.2 Pre-defined communication objects

Devices compliant with this specification come with default values for some communication objects (1000_h to $1FFF_h$), which are not specified in all details in /CiA301/.

6.2.1 Object 1000_h: Device type

This object describes the type of device and its functionality. For multiple device modules the *additional information* field shall contain FFFF_h . In this case, the 67FF_h object shall be implemented. Figure 1 shows the value structure as defined in /CiA301/ and defines the *additional information* field. Table 2 defines the values for the fields *I/O functionality* and *M*. The pre-defined, generic PDO mapping is described in this specification, the device-specific PDO mapping is not in the scope of this specification.

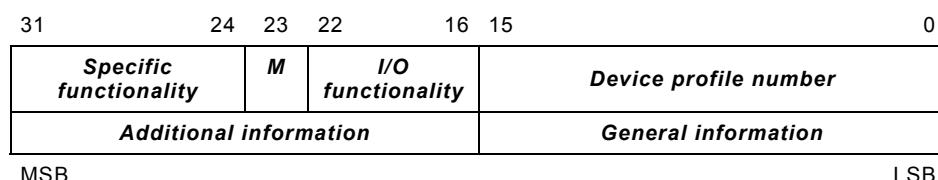

Figure 1 — Value structure

Table 2 — Value definition for *I/O functionality* and *M*

Field name	Definition	
Device profile number	401 _d	
I/O functionality – Bit 16	1 _b = digital input(s) implemented	0 _b = not implemented
I/O functionality – Bit 17	1 _b = digital output(s) implemented	0 _b = not implemented
I/O functionality – Bit 18	1 _b = analogue input(s) implemented	0 _b = not implemented
I/O functionality – Bit 19	1 _b = analogue output(s) implemented	0 _b = not implemented

Field name	Definition
I/O functionality – Bit 20 to Bit 22	Reserved
M(apping of PDOs)	1 _b = Device-specific PDO mapping is supported 0 _b = Pre-defined, generic PDO mapping is supported (see 6.2.4 to 6.2.11)
NOTE Any combination of digital/analogue, inputs and outputs is allowed; one of the bits 16 to 19 shall be 1 _b .	

Table 3 defines the values of the specific functionality sub-field.

Table 3 — Value definition for the specific functionality

Code	Function	Reference
00 _h	No specific function	-
01 _h	Joystick	Appendix A
02 _h	Joystick	Appendix A
03 _h	Joystick	Appendix A
04 _h to FF _h	Reserved	-

6.2.2 Object 1001_h: Error register

The device-specific bit in the status byte is reserved for future use.

6.2.3 Object 1029_h: Error behavior

The object specifies to which state an I/O module shall be set, when a communication error, output error or input error is detected. The following values are defined, all others are reserved:

00_h = transit to NMT pre-operational (only if the current NMT state is operational) state

01_h = remain in current NMT state

02_h = transit to NMT stopped state

In addition to the specification in /CiA301/ the following sub-indices may be implemented.

Table 4 specifies the entry description.

Table 4 — Entry description

Attribute	Value
Sub-Index	02 _h
Description	Output error
Access	rw
Entry category	Optional
PDO mapping	No
Value range	00 _h to 02 _h
Default value	00 _h

Sub-Index	03 _h
Description	Input error
Access	rw
Entry category	Optional
PDO mapping	No
Value range	00 _h to 02 _h
Default value	00 _h

NOTE If the object 1029_h is not implemented, the device behaves in case of communication, input or output failures as defined by the default value.

6.2.4 RPDO 1 (digital outputs)

This RPDO receives the values of up to 64 digital outputs.

NOTE After power-on and application reset the values of the mapped outputs are as the default values or the stored values after configuration (stored values overwrites default values).

Table 5 defines the object description and Table 6 defines the entry description of the RPDO communication parameter.

Table 5 — Object description

Attribute	Value
INDEX	1400 _h
Name	RPDO 1 communication parameter
Object code	Record
Data type	PDO communication parameter record
Category	Conditional: Mandatory, if M-bit in object 1000 _h is set to 0 _b and bit 17 in object 1000 _h is set to 1 _b

Table 6 — Entry description

Attribute	Value
Sub-Index	00 _h
Description	Highest sub-index supported
Access	ro
Entry category	Mandatory
PDO mapping	No

Sub-Index	01 _h
Description	COB-ID
Access	rw
Entry category	Mandatory
PDO mapping	No
Value range	See /CiA301/
Default value	0000 0200 _h + node-ID
<hr/>	

Sub-Index	02 _h
Description	Transmission type
Access	rw
Entry category	Mandatory
PDO mapping	No
Value range	See /CiA301/
Default value	255 _d

Table 7 defines the object description and Table 8 defines the entry description of the RPDO mapping parameter. The number of mapped objects into this RPDO depends on the hardware.

Table 7 — Object description

Attribute	Value
INDEX	1600 _h
Name	RPDO 1 mapping parameter
Object code	Record
Data type	PDO mapping parameter record
Category	Conditional: Mandatory, if 1400 _h is implemented

Table 8 — Entry description

Attribute	Value
Sub-Index	00 _h
Description	Highest sub-index supported
Access	rw
Entry category	Mandatory
PDO mapping	No
Value range	01 _h to 08 _h
Default value	01 _h to 08 _h
Sub-Index	01 _h
Description	1 st application object
Access	rw
Entry category	Mandatory
PDO mapping	No
Value range	See /CiA301/
Default value	6200 01 08 _h
Sub-Index	02 _h
Description	2 nd application object
Access	rw
Entry category	Conditional: Mandatory, if object 6200 02 _h is implemented
PDO mapping	No
Value range	See /CiA301/
Default value	6200 02 08 _h
	to

Sub-Index	08 _h
Description	8 th application object
Access	rw
Entry category	Conditional: Mandatory, if object 6200 08 _h is implemented
PDO mapping	No
Value range	See /CiA301/
Default value	6200 08 08 _h

6.2.5 TPDO 1 (digital inputs)

This TPDO transmits event-driven the values of maximum 64 digital inputs. If one digital input changes its value, this PDO shall be transmitted immediately. If an interrupt mask is enabled, the PDO shall be transmitted only if the interrupt condition is fulfilled.

Table 9 defines the object description and Table 10 defines the entry description of the TPDO communication parameter. The values are defined in /CiA301/. The sub-index 04_h is reserved for compatibility reasons and shall not be implemented.

Table 9 — Object description

Attribute	Value
INDEX	1800 _h
Name	TPDO 1 communication parameter
Object code	Record
Data type	PDO communication parameter record
Category	Conditional: Mandatory, if M-bit in object 1000 _h is set to 0 _b and bit 16 in object 1000 _h is set to 1 _b

Table 10 — Entry description

Attribute	Value
Sub-Index	00 _h
Description	Highest sub-index supported
Access	ro
Entry category	Mandatory
PDO mapping	No
Value range	02 _h to 05 _h
Default value	Manufacturer-specific
Sub-Index	01 _h
Description	COB-ID used by PDO
Access	rw
Entry category	Mandatory
PDO mapping	No
Value range	See /CiA301/
Default value	{0000 0180 _h , 4000 0180 _h } + node-ID

Sub-Index	02 _h
Description	Transmission type
Access	rw
Entry category	Mandatory
PDO mapping	No
Value range	See /CiA301/
Default value	255 _d
Sub-Index	03 _h
Description	Inhibit time
Access	rw
Entry category	Optional
PDO mapping	No
Value range	See /CiA301/
Default value	00 _h
Sub-Index	05 _h
Description	Event timer
Access	rw
Entry category	Optional
PDO mapping	No
Value range	See /CiA301/
Default value	00 _h

Table 11 defines the object description and Table 12 defines the entry description of the TPDO mapping parameter. The number of mapped objects into this TPDO depends on the hardware.

Table 11 — Object description

Attribute	Value
INDEX	1A00 _h
Name	TPDO 1 mapping parameter
Object code	Record

Entry category	Mandatory
PDO mapping	No
Value range	See /CiA301/
Default value	6000 01 08 _h
Sub-Index	02 _h
Description	2 nd application object
Access	rw
Entry category	Conditional: Mandatory, if object 6000 02 _h is implemented
PDO mapping	No
Value range	See /CiA301/
Default value	6000 02 08 _h
to	
Sub-Index	08 _h
Description	8 th application object
Access	rw
Entry category	Conditional: Mandatory, if object 6000 08 _h is implemented
PDO mapping	No
Value range	See /CiA301/
Default value	6000 08 08 _h

6.2.6 RPDO 2 (analogue outputs)

This RPDO receives asynchronously the 16-bit values of maximum 4 analogue outputs to the module. The default transmission type shall be 255.

NOTE After power-on and application reset the values of the mapped outputs are as the default values or the stored values after configuration (stored values overwrites default values).

Table 13 defines the object description and Table 14 defines the entry description of the RPDO communication parameter.

Table 13 — Object description

Attribute	Value
INDEX	1401 _h
Name	RPDO 2 communication parameter
Object code	Record
Data type	PDO communication parameter record
Category	Conditional: Mandatory, if M-bit in object 1000 _h is set to 0 _b and bit 19 in object 1000 _h is set to 1 _b

Table 14 — Entry description

Attribute	Value

Sub-Index	00 _h
Description	Highest sub-index supported

Default value	6411 04 10 _h

6.2.7 TPDO 2 (analogue inputs)

This TPDO transmits event-driven the 16-bit values of maximum 4 analogue inputs. By default the interrupt source (6423_h object) shall be disabled. If one of the mapped analogue input changes its value and 6423_h object is enabled, the PDO is transmitted immediately. If an analogue interrupt condition is enabled, the PDO is transmitted only if this interrupt condition is fulfilled. If more than one interrupt condition is enabled; the PDO is transmitted if one of these conditions is fulfilled.

Table 17 defines the object description and Table 18 defines the entry description of the TPDO communication parameter. The values are defined in /CiA301/. The sub-index 04_h is reserved for compatibility reasons and shall not be implemented.

Table 17 — Object description

6.2.12 Manufacturer-specific PDOs

RPDO 5 to 512 and TPDO 5 to 512 are manufacturer-specific. They shall not be enabled by default.

7 Object dictionary

7.1 Introduction

Each I/O module compliant with this device profile shall share the CANopen object dictionary entries from 6000_h to $67FF_h$. These entries are common to all I/O modules and each module only implements those objects relevant to its functions.

NOTE The manufacturer may add application-specific objects (2000_h to $5FFF_h$) in order to provide manufacturer-specific functionality.

7.2 Input and output function principles

7.2.1 Object dictionary for the digital input and output modules

7.2.1.1 Command sequence

It is possible to switch the modules output or input polarity. This feature is the one which is nearest to the sensors and actuators, e.g. if the polarity of an output is enabled and the output is set to high, then the output level is '0'.

Table 37 defines the profile command sequence.

Table 37 — Profile command sequence

Commands	Polarity switch	Process
Read input	enabled: 0 change to 1	Sensor or actuator
Write output	1 change to 0	
Interrupt mask	disabled: 0 remains 0	
Error mode	1 remains 1	

Figure 2 shows an example of the polarity with a digital output.

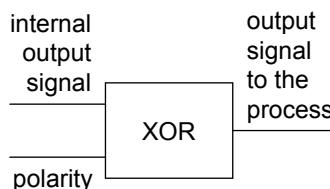

Figure 2 — Polarity bit for digital outputs (example)

7.2.1.2 1-, 8-, 16- and 32-bit access

There are different objects to allow 1-bit, 8-bit, 16-bit or 32-bit access to digital inputs or outputs (e.g. definition of polarity). If these objects define the same function, they access single database. Example: If the 6002_h object (change polarity input 8-bit) sub-index 1_h has the value AA_h and sub-index 2_h the value $0F_h$, 6102_h object (change polarity input 16-bit) sub-index 1_h shall have the value $0FAA_h$.

7.2.1.3 I/O channel to sub-index relation

The bit position shall be calculated by the following formula:

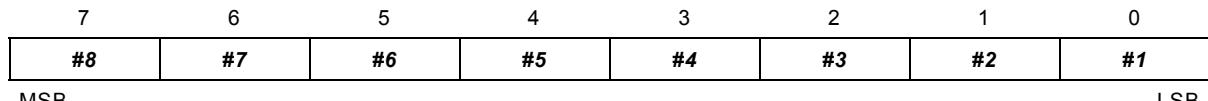

Bit position = (I/O channel no. -1) MOD (length of data type)

The sub-index, where a bit is located, shall be calculated by the following formula:

Sub-index = (I/O channel no. - 1) DIV (length of data type) + 1

Figure 3 shows an example.

Sub-index 01_h

Sub-index 02_b

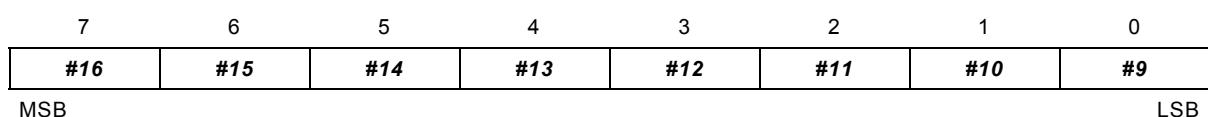

Figure 3 — Example for 8-bit access

7.2.2 Digital input module

There are different access methods defined. By default, 8-bit access shall be supported; the other access methods are optional. Figure 4 shows the relationship between the digital input objects for an 8-bit access.

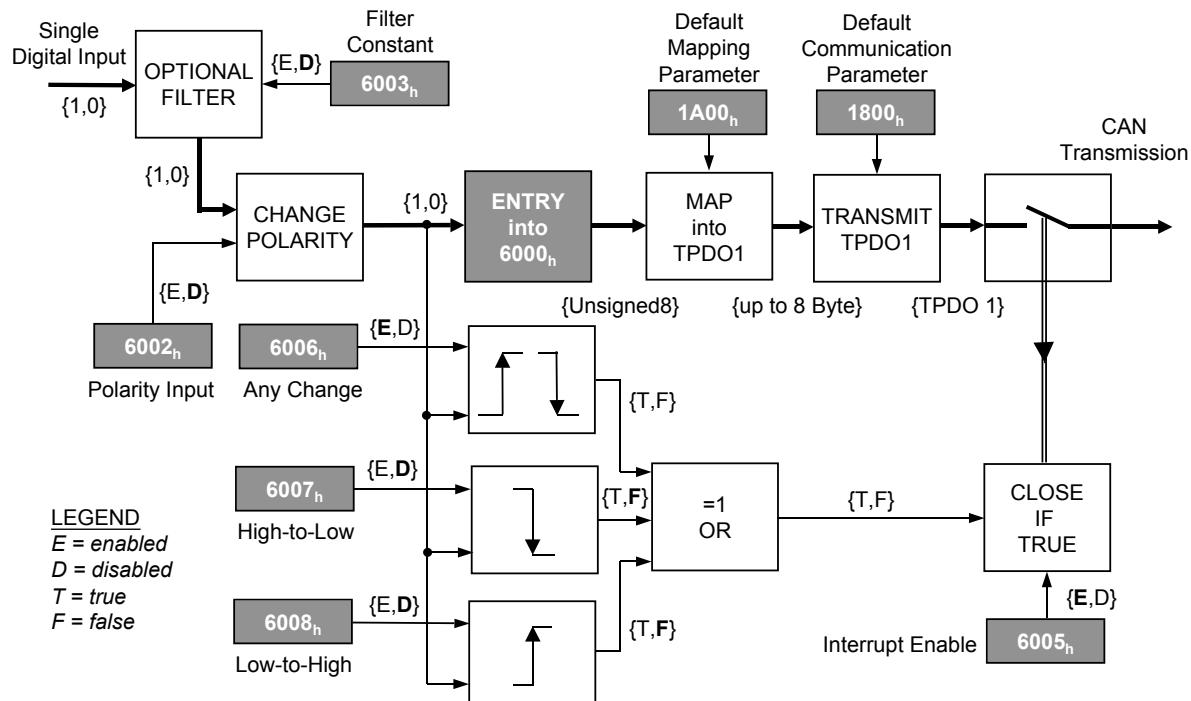

Figure 4 — Block diagram for digital inputs

7.2.3 Digital output module

There are different access methods defined. By default, 8-bit access shall be supported; the other access methods are optional. Figure 5 shows the relationship between the digital output objects for an 8-bit access.

NOTE 1 After power-on or NMT reset application the write output objects are in default state. The digital output application only accepts digital output settings after the device has received the first heartbeat from the device that sets the outputs, or the NMT master has node guarded the device for the first time.

NOTE 2 Device internal failures that cause the digital outputs to error states include Heartbeat events from the device that sets the outputs, or Life guarding events. If node/life guarding is used and the device with NMT master capability is not the digital output setting device, the Node guarding application is responsible to stop the guarding of the digital output device.

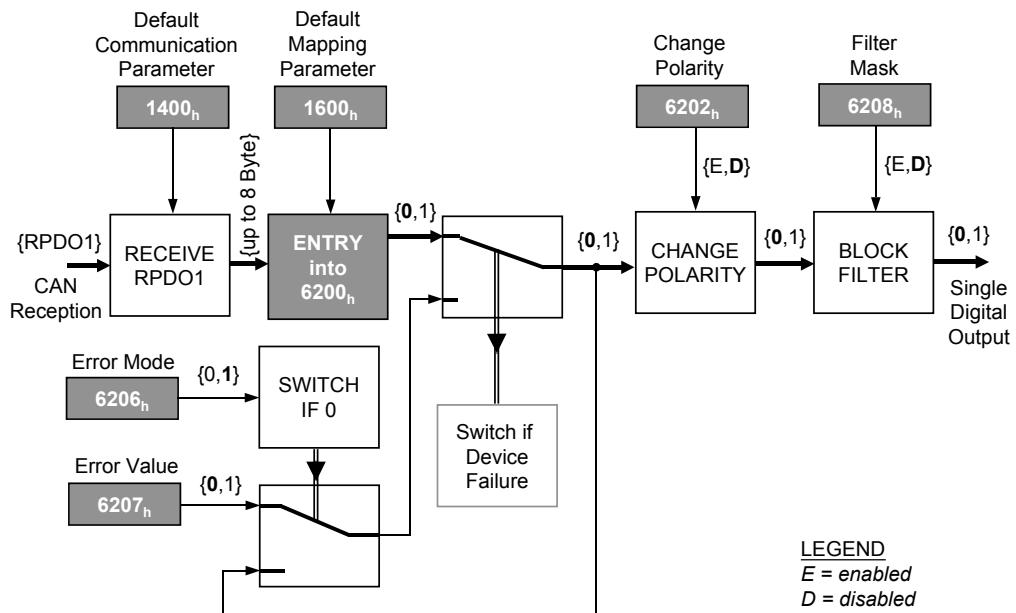

Figure 5 — Block diagram for digital outputs

7.2.4 Analogue input module

There are different access methods defined. By default, 16-bit access shall be supported; the other access methods are optional. Figure 6 shows the relationship between the analogue input objects for 16-bit access.

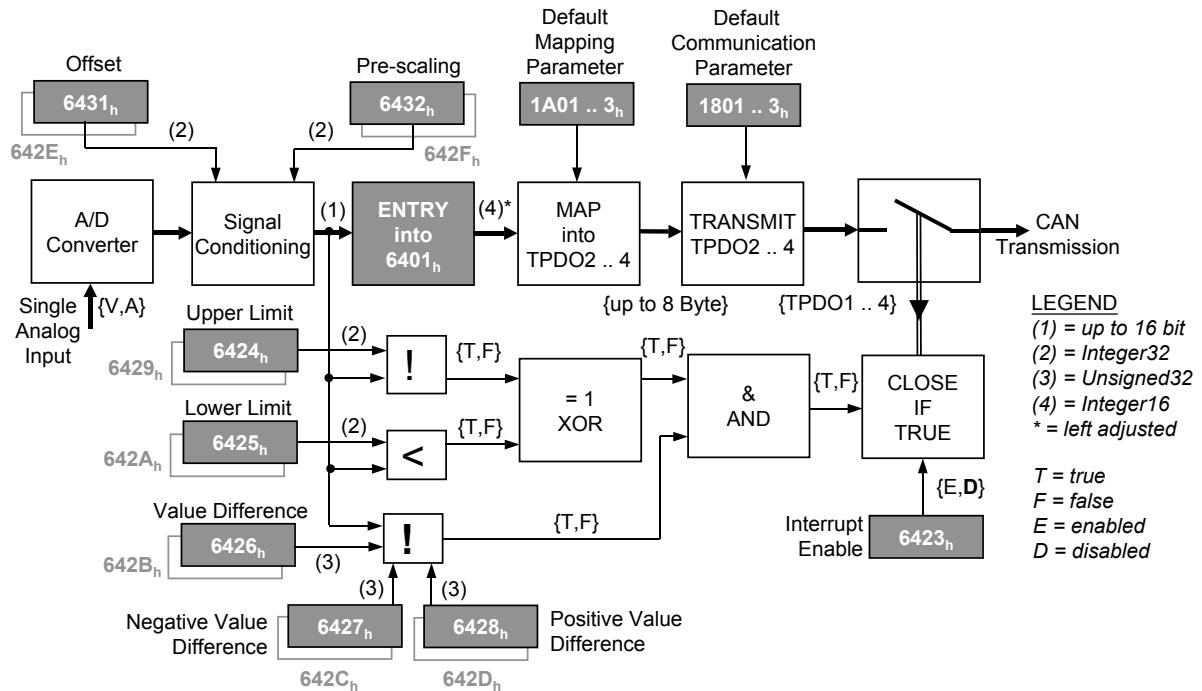

Figure 6 — Block diagram for analogue inputs

7.2.5 Analogue output module

There are different access methods defined. By default, 16-bit access shall be supported; the other access methods are optional. Figure 7 shows the relationship between the analogue output objects for 16-bit access.

NOTE 1 After power-on or NMT reset application the write analogue output objects are in default state. The analogue output application only accepts analogue output settings after the device has received the first heartbeat from the device that sets the outputs, or the NMT master has node guarded the device for the first time.

NOTE 2 Device internal failures that cause the analogue outputs to error states include Heartbeat events from the device that sets the outputs, or Life guarding events. If node/life guarding is used and the device with NMT master capability is not the analogue output setting device, the Node guarding application is responsible to stop the guarding of the analog output device.

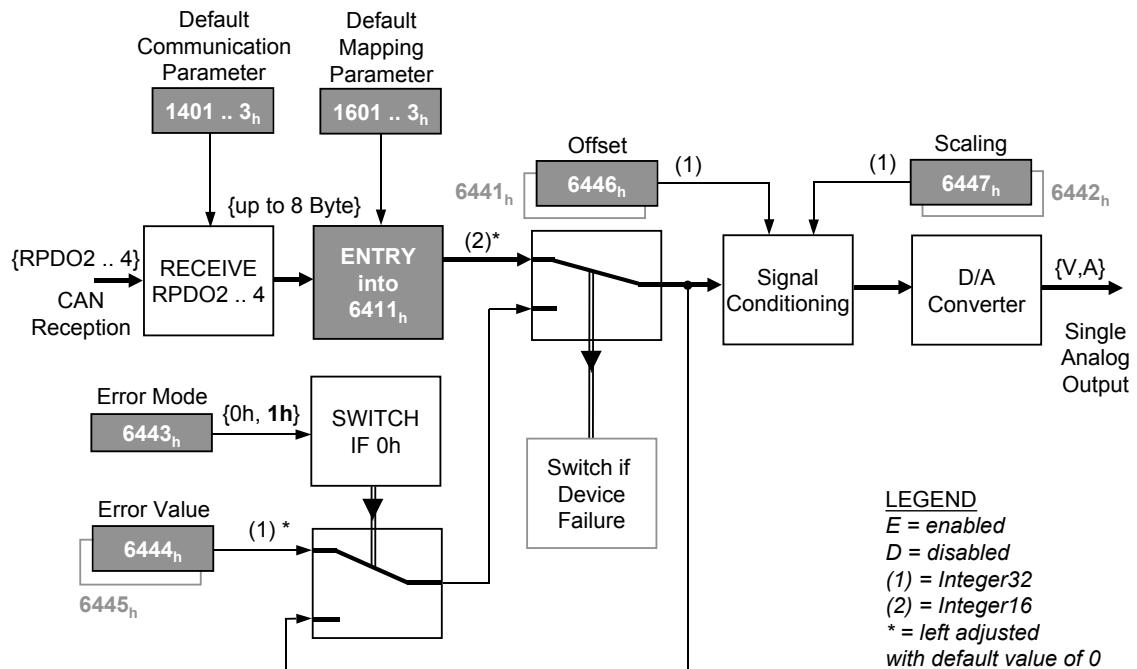

Figure 7 — Block diagram for analogue outputs

8 Detailed object definitions

8.1 Introduction

Each object is defined by the object and entry descriptions. The attribute values for object and entry descriptions are specified in /CiA301/.

8.2 Digital input module

8.2.1 Object 6000_h: Read input 8-bit

This object shall read groups of 8 input lines as 8-bit information. A maximum of 254 x 8-bit inputs is addressable (2032 inputs). This object is mandatory for digital input modules and shall support all implemented input lines.

Table 38 specifies the object description, and Table 39 specifies the entry description.

Table 38 — Object description

Attribute	Value
INDEX	6000 _h
Name	Read input 8 bit
Object code	Array
Data type	Unsigned8
Category	Conditional: Device with digital inputs

Table 39 — Entry description

Attribute	Value
Sub-Index	00 _h
Description	Number of inputs 8-bit
Access	ro
Entry category	Mandatory
PDO mapping	No
Value range	01 _h to FE _h
Default value	Device-specific

Value range	Unsigned8
Default value	No
to	

Sub-Index	FE _h
Description	Read input 7E8 _h to 7F0 _h
Access	ro
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	No

8.2.2 Object 6002_h: Polarity input 8-bit

This object shall define the polarity of a group of 8 input lines. Input polarity can be inverted individually.

1 = input inverted 0 = input not inverted

If the object is not supported the device shall behave accordingly to the default value.

Table 40 specifies the object description, and Table 41 specifies the entry description.

Table 40 — Object description

Default value	00 _h

8.2.3 Object 6003_h: Filter constant input 8-bit

This object shall enable and disable an additional configurable filter constant. If the object is not supported, the device shall behave accordingly to the default value. The type of the filter constant and the configuration of the filter constant are manufacturer-specific.

1 = enabled 0 = disabled

Table 42 specifies the object description, and Table 43 specifies the entry description.

Table 42 — Object description

Attribute	Value
INDEX	6003 _h
Name	Filter constant input 8-bit
Object code	Array
Data type	Unsigned8
Category	Optional

Table 43 — Entry description

Attribute	Value
Sub-Index	00 _h
Description	Number of inputs 8-bit
Access	ro
Entry category	Mandatory
PDO mapping	No
Value range	01 _h to FE _h
Default value	No

Sub-Index	01 _h
Description	Filter constant input 01 _h to 08 _h
Access	rw
Entry category	Mandatory
PDO mapping	Optional
Value range	Unsigned8
Default value	00 _h
Sub-Index	02 _h
Description	Filter constant input 09 _h to 10 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	00 _h
	to
Sub-Index	FE _h
Description	Filter constant input 7E8 _h to 7F0 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	00 _h

8.2.4 Object 6005_h: Global interrupt enable digital 8-bit

This object shall enable and disable globally the interrupt behavior without changing the interrupt masks. In event-driven mode the device transmits the input values depending on the interrupt masks in objects 6006_h, 6007_h, and 6008 (resp. 6050_h to 6057_h, 6060_h to 6067_h, 6070_h to 6077_h, or 6106_h, 6107_h, 6108_h, or 6126_h, 6127_h, 6127_h) and the PDO transmission type. If the object is not supported, the device shall behave accordingly to the default value.

TRUE = global interrupt enabled

FALSE = global interrupt disabled

Table 44 specifies the object description, and Table 45 specifies the entry description.

Table 44 — Object description

Attribute	Value
INDEX	6005 _h
Name	Global interrupt enable digital 8-bit
Object code	Variable
Data type	Boolean
Category	Optional

Table 45 — Entry description

Attribute	Value
Sub-Index	00 _h
Access	rw
PDO mapping	No
Value range	Boolean
Default value	TRUE

8.2.5 Object 6006_h: Interrupt mask any change 8-bit

This object determines, which input port lines shall activate an interrupt by positive or/and negative edge detection.

If the object is not supported the device shall behave accordingly to the default value.

Table 46 specifies the object description, Table 47 and specifies the entry description.

Table 46 — Object description

Attribute	Value
INDEX	6006 _h
Name	Interrupt mask any change 8-bit
Object code	Array
Data type	Unsigned8
Category	Optional

Table 47 — Entry description

Attribute	Value
Sub-Index	00 _h
Description	Number of inputs 8-bit
Access	ro
Entry category	Mandatory
PDO mapping	No
Value range	01 _h to FE _h
Default value	No
Sub-Index	01 _h
Description	Interrupt any change 01 _h to 08 _h
Access	rw
Entry category	Mandatory
PDO mapping	Optional
Value range	Unsigned8
Default value	FF _h

Sub-Index	02 _h
Description	Interrupt any change 09 _h to 10 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	FF _h
to	
Sub-Index	FE _h
Description	Interrupt any change 7E8 _h to 7F0 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	FF _h

8.2.6 Object 6007_h: Interrupt mask low-to-high 8-bit

This object determines, which input port lines shall activate an interrupt by positive edge detection (logical 0 to 1). Done for groups of 8 lines. The values shall be in an "OR" connection to the values of 6006_h object (Interrupt mask any change 8-bit). If inputs are inverted by 6002_h object (polarity input 8-bit), the positive logical edge shall correspond to negative physical edge.

1 = interrupt enabled 0 = interrupt disabled

Table 48 specifies the object description, and Table 49 specifies the entry description.

Table 48 — Object description

Attribute	Value
INDEX	6007 _h
Name	Interrupt mask low-to-high 8-bit
Object code	Array
Data type	Unsigned8
Category	Optional

Table 49 — Entry description

Attribute	Value
Sub-Index	00 _h
Description	Number of inputs 8-bit
Access	ro
Entry category	Mandatory
PDO mapping	No
Value range	01 _h to FE _h
Default value	No

Sub-Index	01 _h
Description	Interrupt low-to-high 01 _h to 08 _h
Access	rw
Entry category	Mandatory
PDO mapping	Optional
Value range	Unsigned8
Default value	00 _h
<hr/>	
Sub-Index	02 _h
Description	Interrupt low-to-high 09 _h to 10 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	00 _h
<hr/>	
to	
Sub-Index	FE _h
Description	Interrupt low-to-high 7E8 _h to 7F0 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	00 _h

8.2.7 Object 6008_h: Interrupt mask high-to-low 8-bit

This object determines, which input port lines shall activate an interrupt by negative edge detection (logical 1 to 0). Done for groups of 8 lines. The values shall be in an "OR" connection to the values of 6006_h object (Interrupt mask any change 8-bit). If inputs are inverted by 6002_h object (polarity input 8-bit), the negative logical edge shall correspond to positive physical edge.

1 = interrupt enabled 0 = interrupt disabled

Table 50 specifies the object description, and Table 51 specifies the entry description.

Table 50 — Object description

Attribute	Value
INDEX	6008 _h
Name	Interrupt mask high-to-low 8-bit

8.2.21 Object 6122_h: Polarity input 32-bit

This object shall define the polarity for a group of 32 input lines. Inputs can be inverted individually.

1 = input inverted 0 = input not inverted

If the object is not supported the device shall behave accordingly to the default value.

Table 78 specifies the object description, and Table 79 specifies the entry description.

Table 78 — Object description

<hr/>	
Sub-Index	FE _h
Description	Interrupt any change input 1FA1 _h to 1FC0 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned32
Default value	FFFF FFFF _h

8.2.24 Object 6127_h: Interrupt mask input low-to-high 32-bit

This object determines, which input port lines shall activate an interrupt. Done for groups of 32 lines and for a change from low-to-high of a digital input line. The values shall be in an "OR" connection to the values of 6126_h object (interrupt mask any change 32-bit). If inputs are inverted by 6122_h object (polarity input 32-bit), the positive logical edge shall correspond to negative physical edge.

1 = interrupt enabled 0 = interrupt disabled

If the object is not supported, the device shall behave accordingly to the default value.

Table 84 specifies the object description, and Table 85 specifies the entry description.

Table 84 — Object description

Attribute	Value
INDEX	6127 _h
Name	Interrupt mask input low-to-high 32-bit

Value range	Unsigned32
Default value	0000 0000 _h

8.2.25 Object 6128_h: Interrupt mask input high-to-low 32-bit

This object determines, which input port lines shall activate an interrupt. Done for groups of 32 lines and for a change from high-to-low of a digital input line. The values shall be in an "OR" connection to the values of 6126_h object (interrupt mask any change 32-bit). If inputs are inverted by 6122_h object (polarity input 32-bit), the negative logical edge shall correspond to positive physical edge.

1 = interrupt enabled 0 = interrupt disabled

If the object is not supported, the device shall behave accordingly to the default value.

Table 86 specifies the object description, and Table 87 specifies the entry description.

Value range	Unsigned8
Default value	00 _h

8.3.2 Object 6202_h: Change polarity output 8-bit

This object shall define the polarity of a group of 8 output lines. Output polarity can be inverted individually.

1 = output inverted

0 = output not inverted

If the object is not supported, the device shall behave accordingly to the default value.

Table 90 specifies the object description, and Table 91 specifies the entry description.

Table 90 — Object description

Attribute	Value
INDEX	6202 _h

Description	Change polarity output 7E9 _h to 7F0 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned8
Default value	00 _h

8.3.3 Object 6206_h: Error mode output 8-bit

This object indicates, whether an output is set to a pre-defined error value (see 6207_h object) in case of an internal device failure or a 'Stop Remote Node' indication.

1 = output value shall take the pre-defined condition specified in 6207_h object

0 = output value shall be kept if an error occurs

If the object is not supported, the device shall behave accordingly to the default value.

Table 92 specifies the object description, and Table 93 specifies the entry description.

Table 92 — Object description

Default value	FF _h

8.3.4 Object 6207_h: Error value output 8-bit

On condition that the corresponding Error mode is active, device failures (see chapter 5.2) shall set the outputs to the value configured by this object.

0 = output shall be set to '0' in case of fault, if 6206_h object is enabled

1 = output shall be set to '1' in case of fault, if 6206_h object is enabled

If the object is not supported, the device shall behave accordingly to the default value.

Table 94 specifies the object description, and Table 95 specifies the entry description.

Default value	00 _h

8.3.5 Object 6208_h: Filter mask output 8-bit

This object defines an additional configurable output filter mask for a group of 8 outputs.

1 = output shall be set to the received output value

0 = don't care, the received output value is neglected for the appropriated output channel, the old output value shall be kept.

If the object is not supported, the device shall behave accordingly to the default value.

Table 96 specifies the object description, and Table 97 specifies the entry description.

Value range	Unsigned16
Default value	0000 _h
<hr/>	
Sub-Index	FE _h
Description	Polarity output FE0 _h to FF0 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned16
Default value	0000 _h

8.3.13 Object 6306_h: Error mode output 16-bit

These objects indicate, whether an output is set to a pre-defined error value (see 6307_h object) in case of an internal device failure a 'Stop Remote Node' indication.

1 = output value shall take the pre-defined condition as specified in 6307_h object

0 = output value shall be kept if an error occurs

If the object is not supported, the device shall behave accordingly to the default value.

Table 112 specifies the object description, and Table 113 specifies the entry description.

Table 112 — Object description

Attribute	Value
INDEX	6306 _h
Name	Error mode output 16-bit
Object code	Array
Data type	Unsigned16
Category	Optional

Table 113 — Entry description

Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned16
Default value	FFFF _h
<hr/>	
to	

Sub-Index	FE _h
Description	Error mode output FE0 _h to FF0 _h
Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned16
Default value	FFFF _h

8.3.14 Object 6307_h: Error value output 16-bit

On condition that the corresponding error mode is active, device failures (see chapter 5.2) shall set the outputs to the value configured by this object.

0 = output shall be set to '0' in case of fault, if 6306h object is enabled

1 = output shall be set to '1' in case of fault, if 6306h object is enabled

If the object is not supported, the device shall behave accordingly to the default value.

Table 114 specifies the object description, and Table 115 specifies the entry description.

Table 114 — Object description

Access	rw
Entry category	Optional
PDO mapping	Optional
Value range	Unsigned16
Default value	0000 _h

8.3.15 Object 6308_h: Filter mask output 16-bit

This object defines an additional configurable output filter mask for a group of 16 outputs.

1 = output is shall set to the received output value

0 = don't care, the received output value is neglected for the appropriated output channel, the old output value shall be kept.

If the object is not supported, the device shall behave accordingly to the default value.

Table 116 specifies the object description, and Table 117 specifies the entry description.

Table 116 — Object description

Default value	Manufacturer-specific

8.6 Analogue input set-ups

8.6.1 Object 6420_h

Reserved for compatibility reason.

8.6.2 Object 6421_h: Analogue input interrupt trigger selection

This object determines, which events shall cause an interrupt for a specific channel. Figure 8 specifies the object structure and Table 148 specifies the value definition. All bits set to 1_b shall trigger the corresponding analogue input. If the object is not supported, the device shall behave accordingly to the default value.

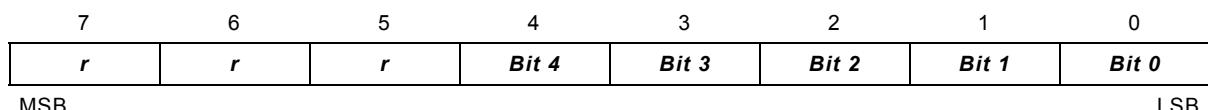

Figure 8 — Object structure

Table 148 = Value definition

Field	Value	Definition
<i>Bit 0</i>	0 _b 1 _b	Upper limit not exceeded Upper limit exceeded
<i>Bit 1</i>	0 _b 1 _b	Input not below lower limit Input below lower limit
<i>Bit 2</i>	0 _b 1 _b	Input not changed by more than delta Input changed by more than delta
<i>Bit 3</i>	0 _b 1 _b	Input not reduced by more than negative delta Input reduced by more than negative delta
<i>Bit 4</i>	0 _b 1 _b	Input not increased by more than positive delta Input increased by more than positive delta
<i>r</i>	0 _b	Reserved for future use

Table 149 specifies the object description, and Table 150 specifies the entry description.

8.6.3 Object 6422_h: Analogue input interrupt source

This object shall determine, which channel has produced an interrupt. Bits set shall relate to the number of any channels that have produced interrupts. The bits shall be reset automatically after read by SDO or transmitted by means of a PDO.

1 = interrupt produced 0 = no interrupt produced

If the object is not supported, the device shall behave accordingly to the default value.

Table 151 specifies the object description, and Table 152 specifies the entry description.

8.6.4 Object 6423_h: Analogue input global interrupt enable

This object shall enable and disable globally the interrupt behavior without changing the interrupt mask. By default, no analogue input activates an interrupt.

TRUE = global interrupt enabled

FALSE = global interrupt disabled

Table 153 specifies the object description, and Table 154 specifies the entry description.

Table 153 — Object description

Attribute	Value
INDEX	6423 _h
Name	Analogue input global interrupt enable

Table 154 — Entry description

Attribute	Value
Sub-Index	00 _h
Access	rw
PDO mapping	Optional
Value range	Boolean
Default value	FALSE

8.6.5 Object 6424_h: Analogue input interrupt upper limit integer

If enabled (see 6423_h object), an interrupt is triggered when the analogue input is equal or rises above the given value. The value shall be always left adjusted. As long as the trigger condition is met, every change of the analogue input data generates a new interrupt, if there is no additional trigger condition, e.g. an input interrupt delta (6426_h).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt upper limit float object (6429_h) shall cause also value change in the 6424_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 155 specifies the object description, and Table 156 specifies the entry description.

Default value	0000 0000 _h

8.6.6 Object 6425_h: Analogue input interrupt lower limit integer

If enabled (see 6423_h object), an interrupt is triggered when the analogue input falls below the given value. The value shall be always left adjusted. As long as the trigger condition is met, every change of the analogue input data generates a new interrupt, if there is no additional trigger condition, e.g. an input interrupt delta (6426_h).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt lower limit float object (642A_h) shall cause also value change in the 6425_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 157 specifies the object description, and Table 158 specifies the entry description.

8.6.7 Object 6426_h: Analogue input interrupt delta unsigned

This object shall set the delta value (rising or falling above or below the last communicated value) for interrupt-enabled analogue inputs (see 6423_h object).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt delta float object (642B_h) shall cause also value change in 6426_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 159 specifies the object description, and Table 160 specifies the entry description.

8.6.8 Object 6427_h: Analogue input interrupt negative delta unsigned

This object shall set the negative delta value (falling below the last communicated value) for interrupt-enabled analogue inputs (see 6423_h object).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt negative delta float object (642C_h) shall cause also value change in the 6427_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 161 specifies the object description, and Table 162 specifies the entry description.

8.6.9 Object 6428_h: Analogue input interrupt positive delta unsigned

This object shall set the positive delta value (rising above the last communicated value) for interrupt-enabled analogue inputs (see 6423_h object).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt positive delta float object (642D_h) shall cause also value change in the 6428_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 163 specifies the object description, and Table 164 specifies the entry description.

8.6.10 Object 6429_h: Analogue input interrupt upper limit float

This object shall set the converted upper limits for interrupt-enabled analogue inputs (see 6423_h object). As long as the trigger condition is met, every change of the analogue input data generates a new interrupt, if there is no additional trigger condition, e.g. an input interrupt delta (642B_h).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt upper limit integer object (6424_h) shall cause also value change in the 6429_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 165 specifies the object description, and Table 166 specifies the entry description.

8.6.11 Object 642A_h: Analogue input interrupt lower limit float

This object shall set the lower limits for interrupt-enabled analogue inputs (see 6423_h object). As long as the trigger condition is met, every change of the analogue input data generates a new interrupt, if there is no additional trigger condition, e.g. an input interrupt delta (642B_h).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt lower limit integer object (6425_h) shall cause also value change in the 642A_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 167 specifies the object description, and Table 168 specifies the entry description.

8.6.12 Object 642B_h: Analogue input interrupt delta float

This object shall set the delta value (rising or falling above or below the last sample) in float format for interrupt-enabled analogue inputs (see 6423_h object).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt delta unsigned object (6426_h) shall cause also value change in the 642B_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 169 specifies the object description, and Table 170 specifies the entry description.

8.6.13 Object 642C_h: Analogue input interrupt negative delta float

This object shall set the negative delta value (falling below the last sample) in float format for interrupt-enabled analogue inputs (see 6423_h object).

If the object is not supported, the device shall behave accordingly to the default value.

Configuration of the analogue input interrupt negative delta unsigned object (6427_h) shall cause also value change in the 642C_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

8.7 Analogue output set-ups

8.7.1 Object 6440_h

Reserved for compatibility reason.

8.7.2 Object 6441_h: Analogue output offset float

This object shall set the offset in float format for output data (6413_h object).

If the object is not supported, the device shall behave accordingly to 6446_h object, or if that object is also not supported, the device shall behave accordingly to the default value.

Configuration of the analogue output offset integer object (6446_h) shall cause also value change in the 6441_h object and vice versa.

Table 185 specifies the object description, and Table 186 specifies the entry description.

Table 185 — Object description

8.7.3 Object 6442_h: Analogue output scaling float

This object shall set the scaling in float format for output data (6413_h object).

If the object is not supported, the device shall behave accordingly to 6447_h object, or if that object is also not supported, the device shall behave accordingly to the default value.

Configuration of the analogue output scaling integer object (6447_h) shall cause also value change in the 6442_h object and vice versa.

Table 187 specifies the object description, and Table 188 specifies the entry description.

8.7.4 Object 6443_h: Analogue output error mode

This object defines, whether an output is set to a pre-defined error value (see 6444_h object) in case of an internal device failure or a 'Stop remote node' indication.

0_h = actual value rest 1_h = reverts to error value integer (6444_h)

others = reserved

If the object is not supported, the device shall behave accordingly to the default value.

Table 189 specifies the object description, and Table 190 specifies the entry description.

8.7.5 Object 6444_h: Analogue output error value integer

On condition that the corresponding Error mode is active, device failures (see chapter 5.2) shall set the outputs to the value configured by this object.

If the object is not supported, the device shall behave accordingly to 6445_h object, or if that object is also not supported, the device shall behave accordingly to the default value.

Configuration of the analogue output error value float object (6445_h) shall cause also value change in the 6444_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 191 specifies the object description, and Table 192 specifies the entry description.

8.7.8 Object 6445_h: Analogue output error value float

On condition that the corresponding error mode is active, device failures (see chapter 5.2) shall set the outputs to the value configured by this object.

If the object is not supported, the device shall behave accordingly to 6444_h object, or if that object is also not supported, the device shall behave accordingly to the default value.

Configuration of the analogue output error value integer object (6444_h) shall cause also value change in the 6445_h object and vice versa.

NOTE The value of this object is not scaled and not offset.

Table 193 specifies the object description, and Table 194 specifies the entry description.

8.8 General device profile objects

8.8.1 Object 67FF_h: Device type

This object shall describe the first logical device in a multiple device module according to /CiA301/.

Annex A : Joystick

A.1 Scope

This appendix defines the use of DS-401 for joysticks adopted as a special input module. This input module supports digital inputs and analogue inputs. The digital inputs are the buttons of the joystick and the analogue inputs are the proportional input values. Optional there are digital outputs for indicating LEDs or general purposes.

A.2 Pre-defined communication objects for joysticks

A.2.1 Object 1000_h: Device type

The specific functionality is defined as a joystick with digital and analogue inputs. Table 201 specifies the values.

Table 201 — Value definitions

Additional information		Device profile number	Description
Specific functionality	I/O functionality		
01 _h	05 _h	0191 _h	I/O functionality without digital outputs
01 _h	07 _h	0191 _h	I/O functionality with digital outputs
02 _h	07 _h	0191 _h	Special PDO mapping for 3-D joystick is used
03 _h	07 _h	0191 _h	Special PDO mapping for 2-D joystick is used

A.3 Joystick buttons

The buttons use the functionality for digital inputs with 8-bit access. The 6000_h object shall be supported and the related configuration objects may be implemented.

A.4 Joystick proportional inputs

The proportional inputs representing the joystick position use the functionality for analogue inputs with signed 16-bit access. An analogue value of zero represents the zero position of the joystick. The object 6401_h shall be supported and all related configuration objects may be implemented.

The default value for the object 6430_h (analogue input SI unit) is defined in Figure 11.

31	24 23	16 15	8 7	0
	00 _h	00 _h	00 _h	00 _h

LSB

Figure 11 — Default value for object 6430_h

A.5 Joystick PDO mappings

A.5.1 Introduction

The joystick device supports the generic CiA 401 mapping as defined in clause A.5.2 and A.5.3 or the specific joystick mappings as defined in clause A.5.4 and A.5.5.

A.5.2 1st TPDO mapping (buttons)

The first TPDO transmits the values of maximum 8 x 8 buttons. The first 8 buttons (Index 6000_h sub-index 01_h) are defined in Figure 12. The unused bits may be used manufacturer-specific.

Diagram illustrating memory bus width configuration. The bus is divided into 8 segments. The first 5 segments are labeled "unused". The next 3 segments are labeled "memory z-axis", "memory y-axis", and "memory x-axis" respectively. The left end is labeled "MSB" and the right end is labeled "LSB".

Figure 12 — Structure of object 6000 01_h

The memory buttons for x-, y-, and z-axes shall freeze the proportional values of the related axes:

1 = memory function on (freeze proportional values)

0 = memory function off (release proportional values)

NOTE It is optional to include the freezing function into the joystick itself. In this case, the proportional values are not modified any more if the memory function is switched on.

Otherwise freezing is done by the application and the buttons are interpreted as freezing request. In this case, the memory buttons have no effect on the proportional input values.

If the joystick does not support memory function, the bits 0 to 2 shall be 0 and the bits 2 to 7 of the first digital input byte (Object 6000_01_h) are used manufacturer-specific.

A.5.3 2nd TPDO mapping (proportional inputs)

The second TPDO transmits the 16-bit values of maximum 4 proportional inputs. The first 3 analogue values (Object 6401 01_h to 03_h) are used for the three dimensions (x, y, z), the other analogue value is manufacturer-specific.

Figure 13 shows the structure of this TPDO.

63	48 47	32 31	16 15	0
<i>manufacturer-specific</i>	<i>z-dimension</i>	<i>y-dimension</i>	<i>x-dimension</i>	

Figure 13 — Structure of the second TPDO

A.5.4 Specific PDO mapping for 3-D joysticks

If the specific functionality field is 02_h, the joystick shall use the first TPDO with the pre-defined mapping as shown in Figure 14.

Figure 14 — Structure of the first TPDO

A.5.5 Specific PDO mapping for 2-D joysticks

If the specific functionality field is 03_h, the joystick shall use the first TPDO with the pre-defined mapping as shown in Figure 15.

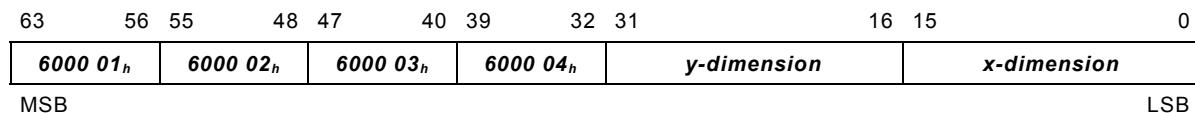

Figure 15 — Structure of the first TPDO

A.6 Joystick signal conditioning

A.6.1 Introduction

The analogue inputs representing the x, y, and z dimension are pre-scaled and offset by using the objects 6432_h ($642F_h$) respectively 6431_h ($642E_h$). If a deadband and post-scaling are required, the objects 6460_h (6461_h) respectively 6462_h (6463_h) are used.

A.6.2 Object 6460_h: Analogue input dead-band unsigned

This object shall set the dead-band for the analogue inputs (6401 01_h to 03_h). Figure 16 shows the relationship between the analogue input objects with dead-band-functionality for 16-bit (and 32-bit) access.

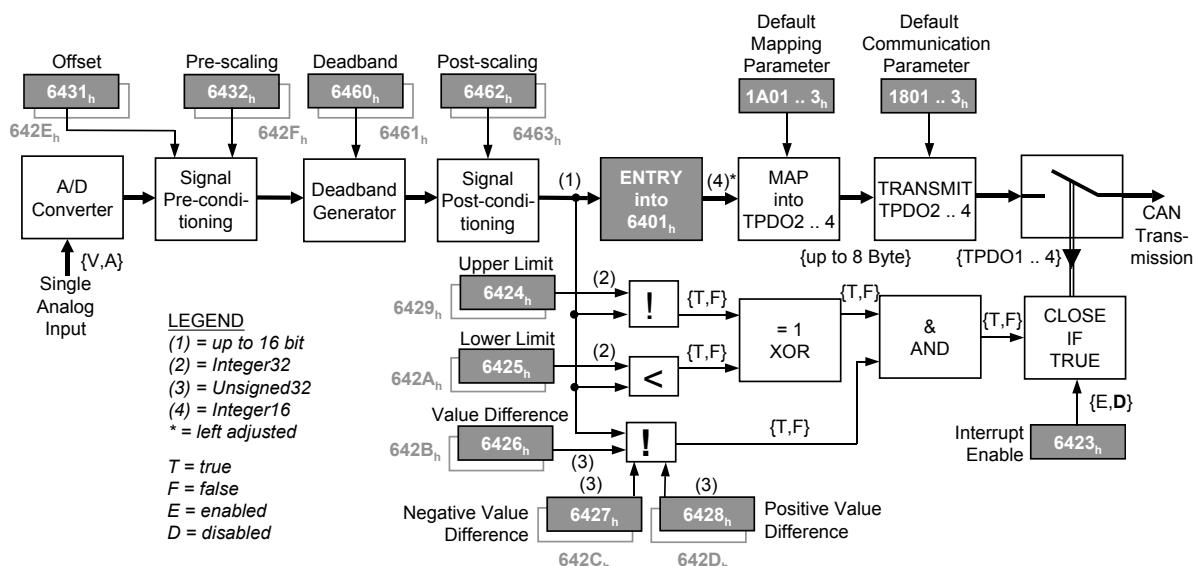

Figure 16 – Analogue Input with dead-band-functionality

Configuration of the analogue input dead-band float object (6461_h) shall cause also value change in the 6460_b object and vice versa.

Table 202 specifies the object description and Table 203 specifies the entry description.

Table 202 — Object description

A.7 Joystick implementation hints

A.7.1 Periodical PDO transmission

If periodical PDO transmission is requested, the event timer is set to ≠ 0.

A.7.2 Additional proportional inputs

If additional proportional inputs are required, the pre-defined 3rd and 4th TPDO are used.

A.7.3 Transmission of proportional inputs

In order to transmit only the first proportional value different from 0, the analogue input set-up objects are used.
