### **General information on licensing and patents**

CAN in AUTOMATION (CiA) calls attention to the possibility that some of the elements of this CiA specification may be subject of patent rights. CiA shall not be responsible for identifying any or all such patent rights.

Because this specification is licensed free of charge, there is no warranty for this specification, to the extent permitted by applicable law. Except when otherwise stated in writing the copyright holder and/or other parties provide this specification "as is" without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The entire risk as to the correctness and completeness of the specification is with you. Should this specification prove failures, you assume the cost of all necessary servicing, repair or correction.

### **Trademarks**

CANopen® and CiA® are registered community trademarks of CAN in Automation. The use is restricted for CiA members or owners of CANopen vendor ID. More detailed terms for the use are available from CiA.

# 1 SCOPE

This document represents the device profile for measuring devices and for universal controller devices for measuring or controlling physical quantities like temperature or pressure. These devices use communication techniques which are conform to those described in /2/. This document should be consulted in parallel to this profile.

### 3 DEFINITIONS AND ABBREVIATIONS

**CAN**

Controller Area Network. Data link layer protocol for serial communication as specified in /1/.

**CiA**

CAN in Automation international users and manufacturers group e.V. Non-profit association promoting Controller Area Network (CAN).

**COB**

Communication Object, which is made of one or more CAN frames. Any information transmitted via CANopen has to be mapped into COB's.

**COB-ID**

COB-Identifier. Identifies a COB uniquely in a CAN network. The identifier determines the priority of that COB in the data link layer, too.

**I/O**

Input and output

**RPDO**

Receive Process Data Object. Communication object of a device, which contains output data.

**SDO**

Service Data Object. Peer-to-peer communication with access to the Object Dictionary of a CANopen device.

**TPDO**

Transmit Process Data Object. Communication object of a device, which contains input data

## 4 OPERATING PRINCIPLE

### 4.1 Introduction

The purpose of this device profile is to describe units for measuring or closed loop control of different physical quantities. As such devices may include quite different functionality, the profile specifies different functional blocks, which could be combined in a real device. Which functional blocks are included is coded within the device type object (1000h)

The purpose of the devices described in this document is to measure or control a physical quantity in a process environment. Often these types of devices are implemented as multiple channel devices.

Once configured via SDO, the device is able to run its measuring or control tasks without necessarily needing further real time communication with host systems. Every device has a large amount of data for configuration purposes. The control loop itself is realised in the controller device. All data of the device has to be accessed via SDO.

In order to reduce busload the device communicates based on events. In general there are three types of events - information, warnings and errors.

- Information - this event is used for indicating that a set-point has been reached, or that an output has been set. Information events may also be used to transfer data (e.g. measuring values) on a cyclical basis. For this purpose it is suggested to use the SYNC-message specification of /2/.
- Warning - this event indicates that a warning limit has been reached,
- Error - this event indicates that an error has occurred on the device.

The event-based communication can be established in the following manner.

1. The device indicates the host device in the network that an event has occurred.
2. The host device reads the data from the device via SDO.

## 4.2 General object dictionary layout

All parameters of the device are accessible via the object dictionary. In order to implement multiple channel devices, parameters are arranged in arrays. Each array has up to number of channels + 5 entries. The maximum number of available channels is 199.

Index	Sub-Index	Parameter
xxxxh	0h	number of entries
	1h	parameter x for channel 1
	:	:
	C7h	parameter x for channel 199
	C8h	reserved
	:	:
	FEh	reserved
	FFh	data type and object type specified in /2/ (optional)

In order to access a particular parameter via SDO, the parameter must be addressed with the index and the channel has to be addressed with the sub-index. Devices with only one channel use the sub-indices 0h and 1h only.

To improve the readability of the object dictionary, all objects are allied to a function block model. This model collects all objects belonging to a specific function to a function block. These are the

1. Digital input function block
2. Analogue input function block
3. Digital output function block
4. Analogue output function block
5. Controller function block
6. Alarm function block
7. Device function block

The function block Controller is divided into functions such as

- process values
- admissible value ranges
- basic controller parameters
- parameter set

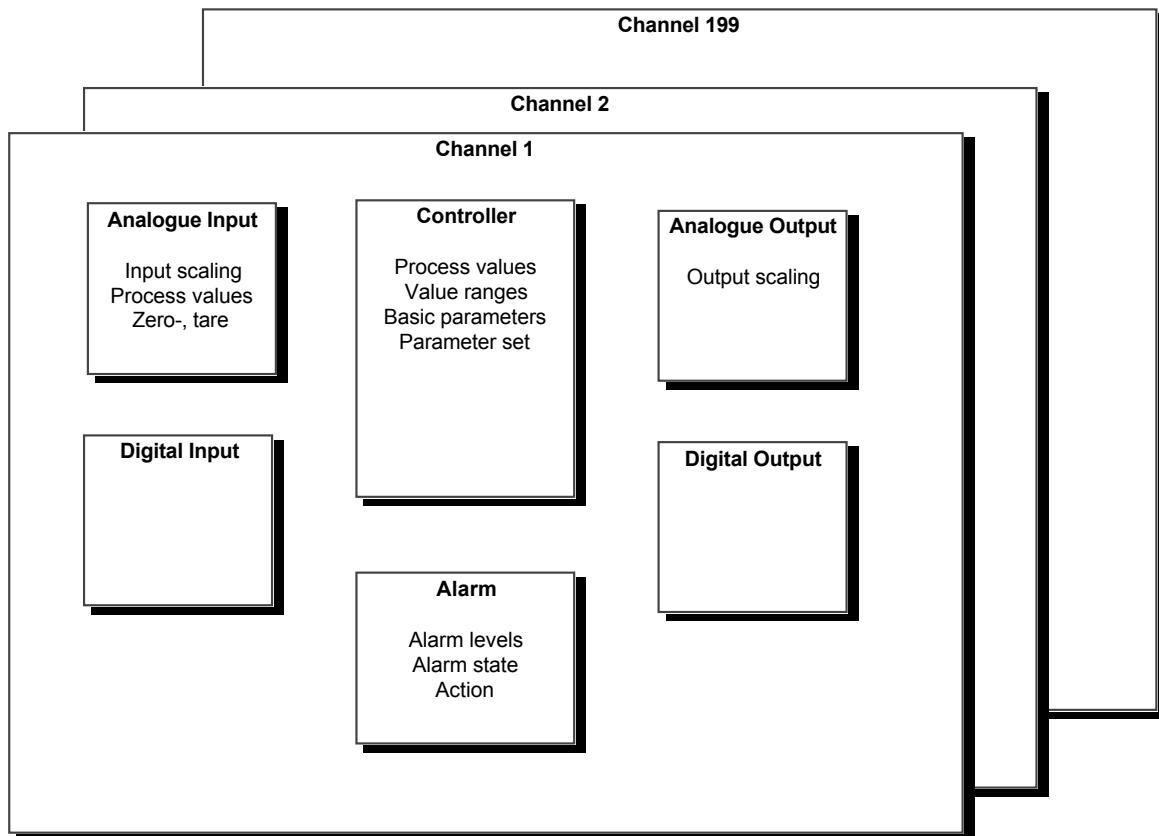

Figure 1: Function block model

#### 4.2.1 Digital input function block

If Module incorporates digital input lines they are addressed according to a subset of the CANopen device profile /3/. Only 1 and 8 Bit access are defined.

#### 4.2.2 Analogue input function block

This functional block may describe the measuring input of a closed loop controller, but may also be used for a sensor with CANopen interface.

The analogue input function block describes how field values are converted to process values.

Examples for **field values** could be:

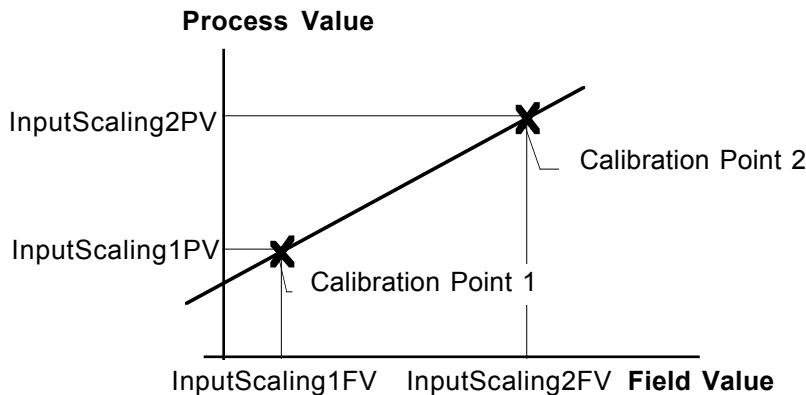

- unscaled readings from analogue digital converter
- counting readings from incremental encoders
- calibrated electrical value at input terminal of measuring transformer (mA, V, mV/V)

These field values are converted to the real physical dimension of the measured quantity, and the result is called "process value".

Examples for **process values** could be:

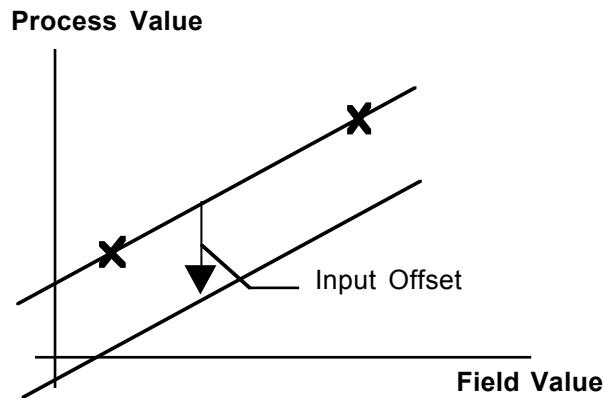

- Value in kg for weight measurement
- Value in Centigrade for temperature measurement
- Value in mm for displacement measurement
- Value in Bar for pressure measurement

The conversion from field value to process value is generally described as a linear transformation. This is defined by two pairs of field value and corresponding process value (Input Scaling 1 FV / Input Scaling 1 PV and Input Scaling 2 FV / Input Scaling 2 PV) called calibration point 1 and 2.

Non-linear transformation (e.g. for thermocouples, PT100 sensors) is Possible and is defined within the parameter "Sensor Type". Then the input scaling values (Input Scaling 1 FV, Input Scaling 1 PV, Input Scaling 2 FV, Input Scaling 2 PV) are meaningless.

The calibration characteristic can be shifted by an additional "input offset" value.

Writing "1" to **auto-zero** will set the zero offset value so that the instantaneous measured process value becomes zero.

The **tare-zero** value works like the zero offset value but results in an additional "net process value".

Writing "1" to **auto-tare** will set the tare zero value so that the instantaneous measured net process value will become zero.

The parameters "**Span Start**" and "**Span End**" define the validity range for the process value. If process value exceeds these limits it will be marked as "overflowed".

**Auto-calibration** starts a cycle where the sensor signal is temporarily replaced by a reference signal and internal errors of the measuring components are corrected.

**Test-Mode** defines a static switch of the input lines to internal reference signals for testing purposes.

#### 4.2.3 Digital output function block

If Module incorporates digital output lines they are addressed by a subset of the CANopen device profile according to /3/. Only 1 and 8 Bit access are defined.

#### 4.2.4      Analogue output function block

The analogue output function block describes how process values are converted to analogue output signals (called output field value).

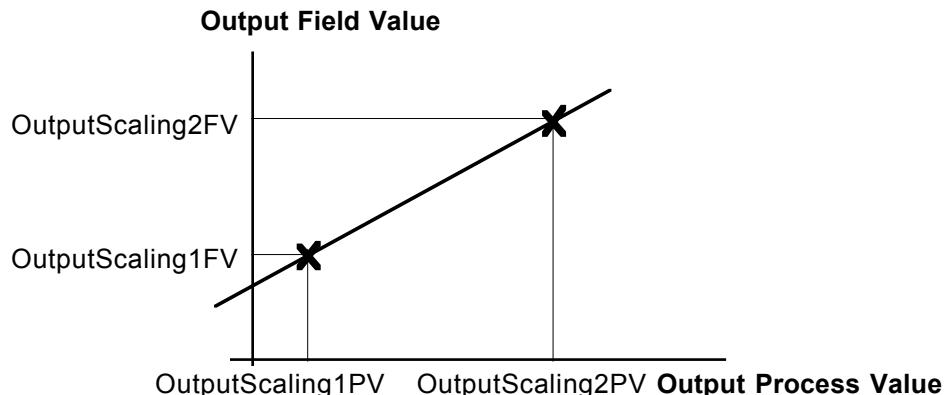

Examples for **output process values** could be:

- Value in kg for weight measurement
- Value in Centigrade for temperature measurement
- Value in mm for displacement measurement
- Value in Bar for pressure measurement

Examples for **output field values** could be:

- unscaled values for digital-analogue converter
- calibrated electrical value for output signal of device (mA, V)

The conversion from output process values to output field values is generally described as a linear transformation. This is defined by two pairs of process values and corresponding output field value (Output Scaling 1 PV / Output Scaling 1 FV and Output Scaling 2 PV / Output Scaling 2 FV).

#### 4.2.5 Controller function block

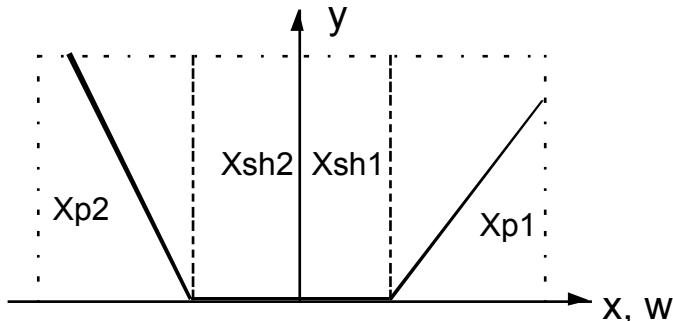

The controller function block describes the PID algorithm for controlling all kinds of process values. The process value might be temperature, pressure, mass flow or any other physical value. The PID controller allows two set-points, a manual override and a self-optimisation.

The controller can be configured as a two-point controller or three-point controller. In the two-point controller mode, the PID algorithm uses the parameters Proportional Band  $Xp1$ , Integral Action Time  $Tn1$ , Derivative Action Time  $Tv1$  and the Cycle Time  $T1$ . In the three-point controller mode the parameters  $Xp2$ ,  $Tn2$ ,  $Tv2$  and  $T2$  will be used, too.

The output of the controller can be limited, e.g. to insure a minimum and a maximum pressure. The output of the controller is a read-only variable. Via the self-optimisation algorithm it is Possible to calculate the necessary PID parameters automatically. Because of different implementations by the manufacturer the starting conditions has to be noticed.

The two Possible set points ( $W$  and  $W2$ ) can only be set within the limits of the objects „Lower Set Point Limit“, ( $W0$ ) and „Upper Set Point Limit“, ( $W100$ ). The switching between these set points is performed via the set point switch.

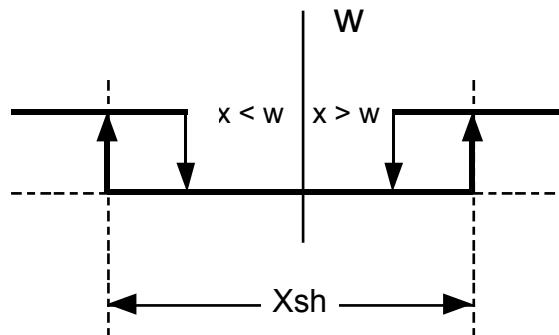

If the controller is configured as three-point controller, a neutral zone can be defined by the parameters  $Xsh1$  and  $Xsh2$ . These parameters have the same physical unit as the current value.

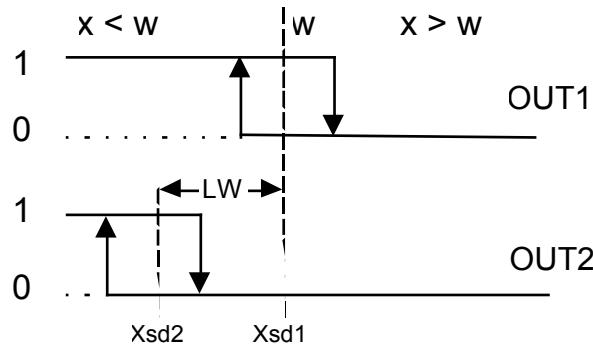

If the controller is configured as three-point stepping controller, a motor response time ( $Tm$ ) has to be defined. The value for  $Xsd$  can be calculated by the equation

$$Xsd = (Tpuls/2) * 0,1 (Xp/Tm).$$

The motor is controlled as shown in the following figure:

The parameters Xsd1, Xsd2 and LW are used to control a signaller with an additional contact. In that case Xsd1 is the switching difference of signaller and Xsd2 is the switching difference of the additional contact. The parameter LW describes the trigger point separation of the additional contact.

#### 4.2.6 Alarm function block

The alarm function block is able to generate alarm messages according to pre-defined alarm conditions like sensor fault, signal value exceeding specified signal levels, difference between two signals exceeding specified level etc. The output of the alarm function block can be mapped to a PDO or may be mapped directly to an output line of the digital output function block. Entering alarm state can also trigger the transmission of emergency messages.

The alarm function block defines objects for up to 16 alarm trigger definitions per channel.

The **Input Value** is compared to **Level** and **Action** is performed when comparison meets the condition specified in **Type**. When for the comparison two input signals are required, the difference between **Input Value** and **Alternate Input Value** is calculated. Input Value and Alternate Input Value may be mapped to a receive PDO or linked to an output of any other function module (analogue input, controller etc.) by **Link** object (e.g. objects 6503h, 6505h). Alarm outputs can be grouped into one of 8 Possible **Groups**, the group alarm is build by a logical or function of the individual alarm states within this group.

Alarms with starting condition are only generated after alarm condition once reaches fault (off) state (after alarm reset). When an alarm **Reset** is performed the state of the alarm is set to off state when input value is within hysteresis and starting condition is reset (relevant only for alarm types with starting condition).

#### 4.2.7 Device function block

This function block includes all objects, which are generally used to control the device.

## 5 ERROR HANDLING

### 5.1 Principle

Emergency Messages are triggered by internal errors in the device and they are assigned the highest Possible priority to ensure that they get access to the bus without latency. By default, the Emergency Messages contain the error field with pre-defined error numbers and additional information.

### 5.2 Error behaviour

If a serious device failure is detected the module shall enter by default autonomously the pre-operational state. If object **1029h** is implemented, the device can be configured to enter alternatively the stopped state or remain in the current state in case of an device failure. Device failures shall include the following communication errors:

- Bus-off conditions of the CAN interface
- Life guarding event with the state 'occurred'
- Heartbeat event with state 'occurred'
- Stop Remote Node indication

Serious device errors also can be caused by device internal failures.

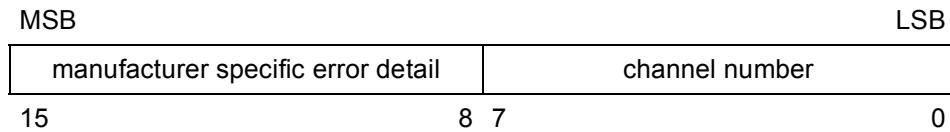

### 5.3 Error code meanings

The error codes are used according to the ones defined within /2/. Within this profile some additional profile specific error codes are defined as follow:

Error Code	Meaning
2110h	Short circuit
2310h	Current at outputs too high (Overload)
2320h	Short circuit at outputs
2330h	Load dump at outputs
5010h	Self Test
5020h	Auto-calibration
5030h	Sensor fault
5031h	Fraction of sensor
5032h	Short circuit of sensor
6310h	Calibration
6311h	Input Calibration
6312h	Output Calibration
6320h	Controller parameters

F002h	Output Overload
F011h	Limit Exceeded
F020h	Tara Overflow
F030h	Self-Optimisation failed

#### 5.4 Additional error codes

The additional error code uses the following format

The least significant byte of the additional error code contains the channel number, where the error occurred (for multiple channel devices). The most significant byte of the additional error code can be used manufacturer specific to give more detailed explanation of the error reason.

## 6 PRE-DEFINITIONS

### 6.1 Principle

As a device may include a set of different functional blocks there are more than the four standard PDO's pre-defined. If there are more than 5 PDO's used the corresponding COB-ID needs to be configured.

### 6.2 Naming conventions

The first three characters of CMS name is a device profile identification and is defined for this device profile as: <404>. (According to the number of this standard).

### 6.3 PDO Mapping

The default mapping defines default values for communication objects 1000h to 1FFFh which are not defined by the communication profile (see /2/).

#### 6.3.1 Object 1000h: Device type

The object at index 1000h describes the type of device and its functionality.

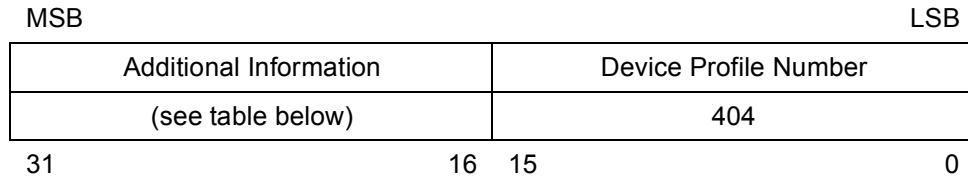

Figure 2: Structure of the Device Type Parameter

Additional information

Bit	Description
16	digital input block
17	analogue input block
18	digital output block
19	analogue output block
20	controller block
21	alarm block
22	reserved
:	:
31	reserved

Bit description:

0 - function block is not present

1 - function block is present

Example: Device with analogue input and alarm function has a device type of 0022 0194h.

#### 6.3.2 Object 1001h: Error Register

The device specific bit in the status word is reserved for future use.

### 6.3.3 Object 1029h: Error Behaviour

This object specifies to which state an I/O module shall be set, when a communication error, output error or input error is detected.

#### OBJECT DESCRIPTION

Index	1029h
Name	Error Behaviour
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	Number of Error Classes
Data Type	Unsigned8
Access	ro
Entry Category	Mandatory
PDO Mapping	No
Value Range	1 – 7h
Default Value	No

Sub-Index	1h
Description	Communication Error
Access	rw
Entry Category	Mandatory
PDO Mapping	No
Value Range	see /2/
Default Value	0

Sub-Index	2h
Description	Digital Input Error
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	see /2/
Default Value	0

Sub-Index	3h
Description	Analogue Input Error
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	see /2/
Default Value	0

Sub-Index	4h
Description	Digital Output Error
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	see /2/
Default Value	0

Sub-Index	5h
Description	Analogue Output Error
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	see /2/
Default Value	0

Sub-Index	6h
Description	Controller Error
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	see /2/
Default Value	0

Sub-Index	7h
Description	Alarm Error
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	see /2/
Default Value	0

Note: If this object is not implemented the device shall be set into pre-operational state in the case a communication error is detected.

#### 6.3.4 1st receive PDO parameters (Received Process Values)

Index	Sub-Index	Comment	Default Value
1400h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value

1600h	0h	number of mapped objects	2
	1h	Received PV 32	9F50 0120h
	2h	Received Status	6F52 0108h

### 6.3.5 1st transmit PDO parameters (Analogue Input)

This PDO is used to transmit input measuring values periodically. By default the transmission of this PDO is initiated by the elapsing of the event timer or as specified by object x133h.

If the transmission type 254 is used, the PDO is transmitted dependent on object x133h. The value of the process value has to change more than the value defined in object x133h between two consecutive transmissions. By default, the signal input is disabled by object 6112h,

Index	Sub-Index	Comment	Default Value
1800h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	1000

Index	Sub-Index	Comment	Default Value
1A00h	0h	number of mapped objects	2 or 3
	1h	AI Input PV 32	9130 0120h
	2h	AI Status	6150 0108h
	3h	AL 1..8 State *	6600 0108h

\*) if available

### 6.3.6 2nd receive PDO parameters (Command Values for Controller)

Index	Sub-Index	Comment	Default Value
1401h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1601h	0h	number of mapped objects	3
	1h	CO Set Point W 16	7402 0110h
	2h	CO Manual Controller Output	6412 0110h
	3h	CO Control Byte	6425 0108h

### 6.3.7 2nd transmit PDO parameters (Effective Controller Output)

This PDO is used to transmit the effective controller output values. The transmission of this PDO is initiated by the elapsing of CO Cycle Time T1 or CO Cycle Time T2.

Index	Sub-Index	Comment	Default Value
1801h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1A01h	0h	number of mapped objects	4
	1h	CO Effective Controller Output	6410 0110h
	2h	CO Effective Current Value 16	7400 0110h
	3h	CO Status Information	6427 0108h
	4h	AL 1..8 State	6600 0108h

### 6.3.8 3rd receive PDO parameters (alternate received process value)

Index	Sub-Index	Comment	Default Value
1402h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1602h	0h	number of mapped objects	2
	1h	Alternate Received PV 32	9F51 0120h
	2h	Alternate Received Status	6F53 0108h

### 6.3.9 3rd transmit PDO parameters (alarm)

By default this PDO is transmitted by a change of the alarm state.

Index	Sub-Index	Comment	Default Value
1802h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1A02h	0h	number of mapped objects	3
	1h	AL 1..8 State	6600 0108h
	2h	AL 9..16 State	6601 0108h
	3h	AL Group 1..8 State	6603 0108h

### 6.3.10 4th receive PDO parameters (Digital Output)

Index	Sub-Index	Comment	Default Value
1403h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1603h	0h	number of mapped objects	8
	1h	DO Write State 8 Output Lines	6200 0108h

	3h	DO Write State 8 Output Lines	6200 0308h
	4h	DO Write State 8 Output Lines	6200 0408h
	5h	DO Write State 8 Output Lines	6200 0508h
	6h	DO Write State 8 Output Lines	6200 0608h
	7h	DO Write State 8 Output Lines	6200 0708h
	8h	DO Write State 8 Output Lines	6200 0808h

### 6.3.11 4th transmit PDO parameters (Digital Input)

This PDO is transmitted by default when there is any change in the digital input lines.

Index	Sub-Index	Comment	Default Value
1803h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1A03h	0h	number of mapped objects	8
	1h	DI Read state 8 Input Lines	6000 0108h
	2h	DI Read state 8 Input Lines	6000 0208h
	3h	DI Read state 8 Input Lines	6000 0308h
	4h	DI Read state 8 Input Lines	6000 0408h
	5h	DI Read state 8 Input Lines	6000 0508h
	6h	DI Read state 8 Input Lines	6000 0608h
	7h	DI Read state 8 Input Lines	6000 0708h
	8h	DI Read state 8 Input Lines	6000 0808h

### 6.3.12 5th receive PDO parameters (Control Bytes)

Index	Sub-Index	Comment	Default Value
1404h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1604h	0h	number of mapped objects	2
	1h	AI Control Byte	6160 0108h
	2h	CO control byte	6425 0108h

**6.3.13 6th receive PDO parameters (Multiplexor PDO)**

This PDO is defined according to /2/. It can be used to write to any object in the object dictionary and may be useful in devices with a large number of channels.

Index	Sub-Index	Comment	Default Value
1404h	0h	number of entries	see /2/
	1h	COB-ID used by PDO	see /2/
	2h	transmission type	255
	3h	inhibit time	0
	4h	reserved	
	5h	event timer	0

Index	Sub-Index	Comment	Default Value
1604h	0h	number of mapped objects (Multiplexor PDO)	255

## 7 OBJECT DICTIONARY

In many applications it is not suitable to stick to a specific data type. In a pure temperature controller application it may be sufficient to transmit the current value as Integer16, whereas in a pressure controller application it may be convenient to use floating point numbers. For this reason the device profile supports four different data types: floating point numbers (Float) as well as 16 bit, 24 bit and 32 bit integers (Integer16, Integer24 and Integer32). To have a better access to the objects in the dictionary, it is divided into four sections:

Index	Data Type
6000h ... 6FFFh	Floating point numbers (Float)
7000h ... 7FFFh	Integer16
8000h ... 8FFFh	Integer24
9000h ... 9FFFh	Integer32

As mentioned in section 4, the universal device is divided in several function blocks. To give the user an easy access to the dictionary, the following structure is used:

Index	Data Type
x000h ... x0FFh	Digital input block
x100h ... x1FFh	Analogue input block
x200h ... x2FFh	Digital output block
x300h ... x3FFh	Analogue output block
x400h ... x4FFh	Controller block
x500h ... x5FFh	Alarm function block
x600h ... xEFFh	reserved
xF00h ... xFFFh	Device function block

The letter „x“ has to be replaced by the number 6, 7, 8, or 9 for the data type.

## 7.1 Survey object dictionary

### 7.1.1 Digital input function block

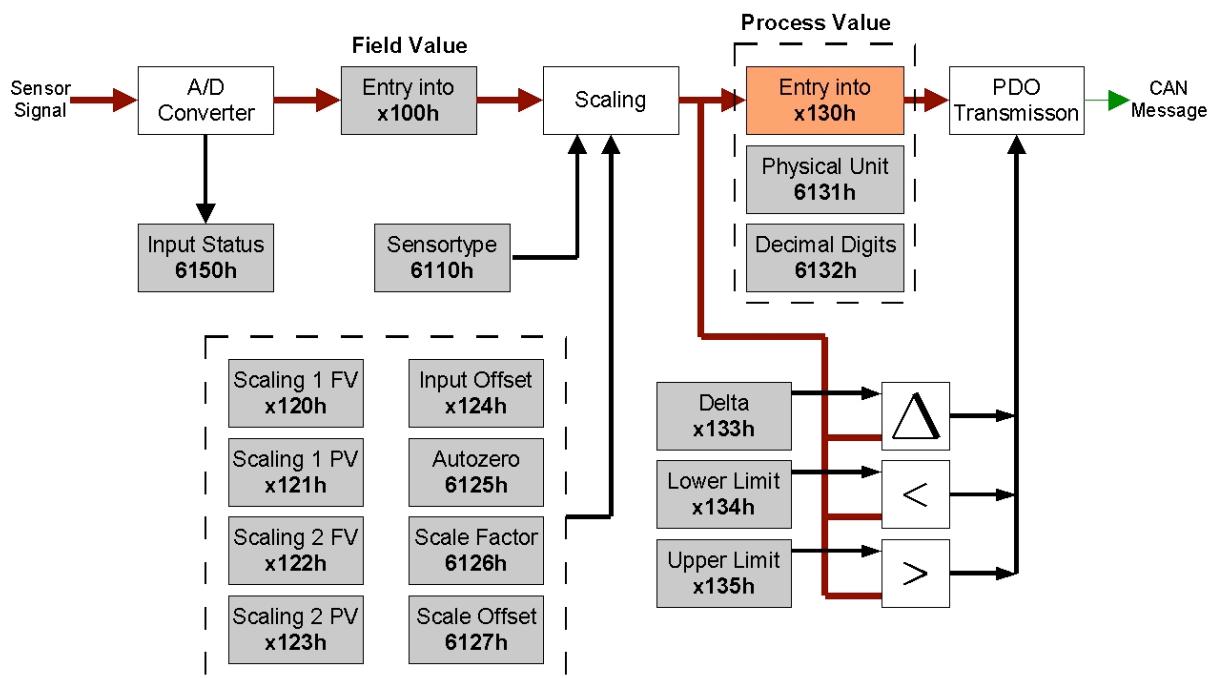

If Module incorporates digital input lines they may be addressed by the CANopen device profile according to device profile specified in /3/. Only 1 and 8 Bit access is defined.

Index	Object Code	Description	Data Type	Acc	PDO mapping	Category
6000h	ARRAY	DI Read state 8 Input Lines	Unsigned8	ro	Possible	C

6612h	ARRAY	AL 9..16 Reset	Unsigned8	wo	Possible	O

- Alarm output lines are configured by using the output function block and linking the lines to the alarm state. Here also polarity etc. can be defined for these output lines.
- Splitting the Alarm State 1..8 and 9..16 into two single byte objects helps keeping PDOs small when Not more than 8 alarms are used.
- Several alarms can be combined by logical „or“ function into group alarms.
- The alarm interrupt will cause asynchronous transmission of 3rd transmit PDO.

### 7.1.7 Device function block

Index	Object Code	Description	Data Type	Acc	PDO mapping	Category
6F20h	ARRAY	Life counter	Unsigned8	ro	Possible	O

## 7.2 Detailed object specification

### 7.2.1 Object 6000h: DI Read state 8 Input Lines

This object shall read groups of 8 input lines as 8-bit information. A maximum of 199 x 8-bit inputs is addressable (1592 inputs). This object is mandatory for modules, which supports digital input lines, and shall support all implemented input lines.

#### OBJECT DESCRIPTION

Index	6000h
Name	DI Read state 8 Input Lines
Object Code	ARRAY
Data Type	Unsigned8
Category	Conditional: device with digital inputs

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Access	ro
Entry Category	Mandatory
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	DI Read state 8 Input Lines 1
Access	ro
Entry Category	Mandatory
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	DI Read state 8 Input Lines 2
Access	ro
Entry Category	Optional
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	DI Read state 8 Input Lines 199
Access	ro
Entry Category	Optional
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.2 Object 6002h: DI Polarity 8 Input Lines

This object shall define the polarity of a group of 8 input lines. Input polarity can be inverted individually.

0 = input not inverted

1 = input inverted

If the object is not supported the device shall behave accordingly to the default value.

## OBJECT DESCRIPTION

Index	6002h
Name	DI Polarity 8 Input Lines
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Access	ro
Entry Category	Mandatory
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	DI Polarity 8 Input Lines 1
Access	rw
Entry Category	Mandatory
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

Sub-Index	2h
Description	DI Polarity 8 Input Lines 2
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

to

Sub-Index	C7h
Description	DI Polarity 8 Input Lines 199
Access	Rw
Entry Category	Optional
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

### 7.2.3 Object 6020h: DI Read state 1 Input Lines

This object shall read single input lines information. A maximum of 199 input lines is addressable at this index.

#### OBJECT DESCRIPTION

Index	6020h
Name	DI Read state 1 Input Lines
Object Code	ARRAY
Data Type	Boolean
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Access	ro
Entry Category	Mandatory
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	DI Read state 1 Input Lines 1
Data Type	Boolean
Access	ro
Entry Category	Mandatory
PDO Mapping	Possible
Value Range	Boolean
Default Value	No

Sub-Index	2h
Description	DI Read state 1 Input Lines 2
Data Type	Boolean
Access	ro
Entry Category	Optional
PDO Mapping	Possible
Value Range	Boolean
Default Value	No

to

Sub-Index	C7h
Description	DI Read state 1 Input Lines 199
Data Type	Boolean
Access	ro
Entry Category	Optional
PDO Mapping	Possible
Value Range	Boolean
Default Value	No

## 7.2.4 Object 6030h: DI Polarity 1 Input Lines

This object shall define the polarity of single input lines. A maximum of 199 input lines is addressable at this index.

0 = input not inverted

1 = input inverted

If the object is not supported the device shall behave accordingly to the default value.

### OBJECT DESCRIPTION

Index	6030h
Name	DI Polarity 1 Input Lines
Object Code	ARRAY
Data Type	Boolean
Category	Optional

### ENTRY DESCRIPTION

Sub-Index	0
Description	number of entries
Access	ro
Entry Category	Mandatory
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	DI Polarity 1 Input Lines 1
Access	rw
Entry Category	Mandatory
PDO Mapping	No
Value Range	Boolean
Default Value	0

Sub-Index	2h
Description	DI Polarity 1 Input Lines 2
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	Boolean
Default Value	0

to

Sub-Index	C7h
Description	DI Polarity 1 Input Lines 199
Access	rw
Entry Category	Optional
PDO Mapping	No
Value Range	Boolean
Default Value	0

### 7.2.5 Object x100h: AI Input FV

This object represents the converted value of an analogue input module, which is not yet scaled to the physical unit of the quantity being measured. Scaling could be e.g. digits of the analogue digital converter used or Ohms for Pt100 temperature measurement.

The value shall be always left adjusted. The remaining bits are at the right side of the LSB shall be set to zero.

#### OBJECT DESCRIPTION

Index	x100h
Name	AI Input FV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Access	ro
Entry Category	Mandatory
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AI Input FV 1
Access	ro

Access	ro
Entry Category	Optional
PDO Mapping	Possible
Value Range	Data type specific
Default Value	No

to

Sub-Index	C7h
Description	AI Input FV 199
Access	ro
Entry Category	Optional
PDO Mapping	Possible
Value Range	Data type specific
Default Value	No

### 7.2.6 Object x103h: AI Interrupt delta input FV

When Input Field Value is mapped to a transmit PDO and its value has changed delta or more since the last PDO transmission then the PDO is transmitted again. A delta value of 0 means, that this function is disabled.

## OBJECT DESCRIPTION

Index	x103h
Name	AI Interrupt delta input FV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AI Interrupt delta input FV 1
Entry Category	Mandatory

PDO Mapping	No
Value Range	Data type specific
Default Value	No

Sub-Index	2h
Description	AI Interrupt delta input FV 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Data type specific
Default Value	No

to

Sub-Index	C7h
Description	AI Interrupt delta input FV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Data type specific
Default Value	No

### 7.2.7 Object 6110h: AI Sensor type

Specifies the type of sensor, which is connected to the analogue input.

Value	Meaning
0	reserved
1	Thermocouple type J

Value	Meaning
2	Thermocouple type K
3	Thermocouple type L
4	Thermocouple type N
5	Thermocouple type R
6	Thermocouple type S
7	Thermocouple type T
8 ... 29	reserved (other types of thermocouple)
30	PT100
31	PT200
32	PT500
33	PT1000
34	PT5000
35	IR-Sensor
36 .. 39	reserved
40	Voltage
41	+/- 10 V
42	0 .. 10 V
43	+/- 1 V
44	0 .. 1 V
45	+/- 100 mV
46	0 .. 100 mV
47 .. 49	reserved
50	Current
51	4..20mA
52	0..20mA
53 .. 59	reserved
60	Frequency
61 ... 69	reserved
70	Strain gauge
71	Strain gauge full bridge
72	Strain gauge half bridge
73	Strain gauge quarter bridge
74 .. 79	reserved
80	LVDT
81 .. 89	reserved
90	Pressure Transducer
91 .. 99	reserved
100	Temperature transducer
101 .. 119	reserved
120	Potentiometer
121 ... 9999	reserved
10000 ... 65535	manufacturer specific use

## OBJECT DESCRIPTION

Index	6110h

Default Value	No

**7.2.8 Object 6111h: AI Autocalibration**

Writing a signature value of „cali“ to this object starts auto-calibration cycle of the analogue input channel for one time.

If a wrong signature is written, the device refuses to calibrate and respond with an abort message (abort code 0800 002xh)

	Signature	MSB	LSB
ASCII	i	I	a
hex	69	6C	61

## OBJECT DESCRIPTION

Index	6111h
Name	AI Autocalibration
Object Code	ARRAY
Data Type	Unsigned32
Category	Optional

## ENTRY DESCRIPTION

Access	wo
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

**7.2.9 Object 6112h: AI Operating mode**

A value different from 0 sets the analogue input channel to special operating modes.

Value	Meaning
0	Channel off (Not operating)
1	Normal operation
2 ... 9	Reserved
10 ... 255	Implementation specific

## OBJECT DESCRIPTION

Index	6112h
Name	AI Operating mode
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

## ENTRY DESCRIPTION

to

Sub-Index	C7h
Description	AI Input offset 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	0

**7.2.16 Object 6125h: AI Autozero**

Writing a signature value of „zero“ to this object causes a modification of the AI Input Offset in such a way that the actual AI Input PV becomes zero. This cycle is performed for one time.

Signature	MSB	LSB
ASCII	o r e z	
hex	6f 72 65 7A	

## OBJECT DESCRIPTION

Index	6125h
Name	AI Autozero
Object Code	ARRAY
Data Type	Unsigned32
Category	Optional

Default Value	No

**7.2.20 Object 6131h: AI Physical unit PV**

This object shall assign SI units and prefixes for the process values within the analogue input function block. The structure of the SI unit entry is as follows:

The coding of the physical units and prefixes is done according to the /5/. Within this profile, there are some additional physical units specified:

<b>Code</b>	<b>Physical Unit</b>
55 <sub>h</sub>	m/s
56 <sub>h</sub>	Nm
A1 <sub>h</sub>	at
A2 <sub>h</sub>	mmH <sub>2</sub> O
A3 <sub>h</sub>	mHG
A4 <sub>h</sub>	atm
AB <sub>h</sub>	PSI
AC <sub>h</sub>	°F

### 7.2.21 Object 6132h: AI Decimal digits PV

This object describes the number of decimal digits following the decimal point for interpretation of data types Integer8, Integer16 and Integer32.

Example: A field value of 1.230 (Float) will be coded as 123 in Integer16 format if number of decimal digits is set to 2.

#### OBJECT DESCRIPTION

Index	6132h
Name	AI Decimal digits PV
Object Code	ARRAY
Data Type	Unsigned8

Default Value	No

**7.2.25 Object x138h: AI Tare zero**

This object defines the tare-offset value. Net process value is calculated by subtracting the tare-offset value from the process value. It is scaled in physical unit of process value.

## OBJECT DESCRIPTION

Index	x138h
Name	AI Tare zero
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries

Description	AI Tare zero 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	0

**7.2.26 Object 6139h: AI Autotare**

Writing a signature value of „tara“ to this object causes a modification of the AI Tare Zero in such a way that the actual AI Net PV becomes zero. This cycle is processed one time.

	Signature	MSB	LSB
ASCII	a r a t	61 72 61 74	
hex			

## OBJECT DESCRIPTION

Index	6139h
Name	AI Autotare
Object Code	ARRAY
Data Type	Unsigned32
Category	Optional

Access	ro
PDO Mapping	Possible
Value Range	data type specific
Default Value	No

**7.2.28 Object x143h: AI Interrupt delta net PV**

When Net Process Value is mapped to a transmit PDO and its value has changed delta or more since the last PDO transmission then the PDO is transmitted again. A delta value of 0 means, that this function is disabled.

## OBJECT DESCRIPTION

Index	x143h
Name	AI Interrupt delta net PV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

Description	<b>AI Span end 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

**7.2.33 Object 6150h: AI Status**

This read-only object reflects the status of the analogue input channels.

The combination of bit 1 and bit 2 has not to be possible.

For example:

Value	Meaning
00h	No failure at analogue input
03h	Positive overload, eg.g. Pt100 sensor break

## OBJECT DESCRIPTION

Index	6150h
Name	AI Status
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro

Description	AI Status 199
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.34 Object 6160h: AI Control byte

This write-only object starts several control functions of the analogue input function block

For example:

Value	Meaning
00h	Access to the control byte object is not possible
03h	Allow auto-calibration and auto-zero

#### OBJECT DESCRIPTION

Index	6160h
Name	<b>AI Control byte</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	<b>AI Control byte 1</b>
Entry Category	Mandatory
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	<b>AI Control byte 2</b>
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	<b>AI Control byte 199</b>
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.35 Object 6161h: AI Control byte enable

Bit mask to enable the single bits in object 6160h (AI Control byte enable).

0 – disabled function

1 – enabled function

#### OBJECT DESCRIPTION

Index	6161h
Name	AI Control byte enable
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AI Control byte enable 1
Entry Category	Mandatory
Access	rw

Value Range	Unsigned8
Default Value	0

to

Sub-Index	C7h
Description	AI Control byte enable 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

### 7.2.36 Object 61A0h: AI Filter type

The object shall define the type of filter to be used for calculation.

Value	Description
0	No filter
1	Moving average
2	Repeating average
3 .. 99	reserved
100 .. 255	Manufacturer specific

- Calculation of moving average**

There has to be calculated the difference between the current value derived from the A/D converter and the previous calculated average value. This current calculated difference has to be divided by a filter constant (see object 61A1h) and added to the previous calculated sum.

$$Value_N = Value_{N-1} + \frac{Input - Value_{N-1}}{Filterconstant}$$

- Calculation of repeating average**

At any reading of the current value from the A/D converter the value has to be added to the sum. At any N-th reading (depending on the value of object 61A1h) the sum will be divided by N. Following the value will be set to zero for the next calculation.

$$Value = \frac{\sum_{n=1}^N Input_n}{N}$$

#### OBJECT DESCRIPTION

Index	61A0h
Name	AI Filter type
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory

Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

### 7.2.38 Object 6200h: DO Write state 8 output lines

This object shall set a group of 8 output lines as a byte of information. A maximum of 199 x 8-bit output blocks is addressable.

#### OBJECT DESCRIPTION

Index	6200h
Name	DO Write state 8 output lines
Object Code	ARRAY
Data Type	Unsigned8
Category	Conditional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	DO Write state 8 output lines 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

Sub-Index	2h

Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

### 7.2.39 Object 6202h: DO Polarity 8 output lines

This object shall define the polarity of a group of 8 output lines. Output polarity can be inverted individually.

0 – output not inverted                  1 – output inverted

If the object is not supported the device behaves accordingly to the default value.

#### OBJECT DESCRIPTION

Index	6202h
Name	<b>DO Polarity 8 output lines</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro

Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

Sub-Index	2h
Description	<b>DO Polarity 8 output lines 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

to

Sub-Index	C7h
Description	<b>DO Polarity 8 output lines 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

#### 7.2.40 Object 6206h: DO Fault mode 8 output lines

Defines the fault mode of a group of 8 output lines (1 bit per line).

0 – output value shall be kept if an fault occurs

1 – output value shall take the pre-defined condition specified in Object 6207h: DO Fault state 8 output lines

##### OBJECT DESCRIPTION

Index	6206h
Name	DO Fault mode 8 output lines
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

##### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro

Description	DO Fault mode 8 output lines 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	FFh

Sub-Index	2h
Description	DO Fault mode 8 output lines 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	FFh

to

Sub-Index	C7h
Description	DO Fault mode 8 output lines 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	FFh

#### 7.2.41 Object 6207h: DO Fault state 8 output lines

Defines the pre-defined state on detecting a fault condition. Defined for a group of 8 output lines. The corresponding bit must be set in the default output line mode (see Object 6206h: DO Fault mode 8 output lines).

0 – output is set to ‘0’ in case of fault, if Object 6206h: DO Fault mode 8 output lines is enabled

1 – output is set to ‘1’ in case of fault, if Object 6206h: DO Fault mode 8 output lines is enabled

##### OBJECT DESCRIPTION

Index	6207h
Name	<b>DO Fault state 8 output lines</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

##### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries

#### 7.2.48 Object x300h: AO Output PV

This object represents the process value, which is the input to the analogue output function block.

It is scaled in the physical unit of process values (e.g. degrees centigrade, kg, kN, mm etc.).

##### OBJECT DESCRIPTION

Index	x300h
Name	AO Output PV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32

Default Value	0

#### 7.2.49 Object 6301h: AO Physical unit PV

This object describes the physical unit for the process values within the analogue output function block (see Object 6131h: AI Physical unit PV).

##### OBJECT DESCRIPTION

Index	6301h
Name	AO Physical unit PV
Object Code	ARRAY
Data Type	Unsigned32
Category	Optional

##### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AO Physical unit PV 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned16
Default Value	No

Sub-Index	2h
Description	AO Physical unit PV 2
Entry Category	Optional
Access	rw

Value Range	Unsigned16
Default Value	No

to

Sub-Index	C7h
Description	AO Physical unit PV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned16
Default Value	No

### 7.2.50 Object 6302h: AO Decimal digits PV

This object describes the number of decimal digits following the decimal point for interpretation of data types Integer8, Integer16 and Integer32.

Example: A field value of 1.230 (Float) will be coded as 123 in Integer16 format if number of decimal digits is set to 2.

#### OBJECT DESCRIPTION

Index	6302h
Name	AO Decimal digits PV
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AO Decimal digits PV 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	0 – 9h
Default Value	No

Sub-Index	2h
Description	AO Decimal digits PV 2
Entry Category	Optional
Access	rw

Value Range	0 – 9h
Default Value	No

to

Sub-Index	C7h
Description	AO Decimal digits PV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 – 9h
Default Value	No

### 7.2.51 Object 6303h: AO Link output PV

This object describes the source for the AO Output PV if it lies within another functional block of the same device. The object defined by index and sub-index is directly linked to the AO Output PV.

#### OBJECT DESCRIPTION

Index	6303h
Name	AO Link output PV
Object Code	RECORD
Data Type	PDOmapping
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - 199
Default Value	No

Sub-Index	1h
Description	AO Link output PV 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

Sub-Index	2h
Description	AO Link output PV 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

to

Sub-Index	C7h
Description	AO Link output PV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

### 7.2.52 Object 6310h: AO Output type

This object specifies the type of the analogue output.

Value	Meaning
0 .. 9	reserved
10	Voltage
11	+/-10V
12 .. 19	reserved
20	Current
21	4..20mA
22	+/-20mA
23 .. 29	reserved
30	Frequency
31 .. 39	reserved
40	PWM
41 ... 999	reserved
1000 .. 65535	manufacturer specific

## OBJECT DESCRIPTION

Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned16
Default Value	No

**7.2.53 Object x320h: AO Output scaling 1 PV**

This object defines the process value of the first calibration point for the analogue output channel. It is scaled in physical unit of process value.

## OBJECT DESCRIPTION

Index	x320h
Name	AO Output scaling 1 PV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AO Output scaling 1 PV 1
Entry Category	Mandatory

Description	AO Output scaling 1 PV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.54 Object x321h: AO Output scaling 1 FV

This object defines the field value of the first calibration point for the analogue output channel. It is scaled in physical unit of field value.

#### OBJECT DESCRIPTION

Index	x321h
Name	AO Output scaling 1 FV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AO Output scaling 1 FV 1
Entry Category	Mandatory

to

Sub-Index	C7h
Description	AO Output scaling 1 FV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.55 Object x322h: AO Output scaling 2 PV

This object defines the process value of the second calibration point for the analogue output channel. It is scaled in physical unit of process value.

#### OBJECT DESCRIPTION

Index	x322h
Name	AO Output scaling 2 PV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AO Output scaling 2 PV 1
Entry Category	Mandatory
Access	rw

Default Value	No

to

Sub-Index	C7h
Description	AO Output scaling 2 PV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.56 Object x323h: AO Output scaling 2 FV

This object defines the field value of the second calibration point for the analogue output channel. It is scaled in physical unit of field value.

#### OBJECT DESCRIPTION

Index	x323h
Name	AO Output scaling 2 FV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AO Output scaling 2 FV 1

Default Value	No

to

Sub-Index	C7h
Description	AO Output scaling 2 FV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.57 Object x330h: AO Output FV

This object represents result of the output scaling for the analogue output channel and gives the output quantity scaled in the physical unit of field values (e.g. Volt, mA etc.).

#### OBJECT DESCRIPTION

Index	x330h
Name	AO Output FV
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AO Output FV 1
Entry Category	Mandatory

Value Range	Unsigned32
Default Value	No

to

Sub-Index	C7h
Description	AO Physical unit FV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

### 7.2.59 Object 6332h: AO Decimal digits FV

This object describes the number of decimal digits following the decimal point for interpretation of data types Integer8, Integer16 and Integer32.

Example: A field value of 1.230 (Float) will be coded as 123 in Integer16 format if number of decimal digits is set to 2.

## OBJECT DESCRIPTION

Index	6332h
Name	AO Decimal digits FV
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro

PDO Mapping	No
Value Range	0 – 9h
Default Value	No

to

Sub-Index	C7h
Description	AO Decimal digits FV 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 – 9h
Default Value	No

**7.2.60 Object 6340h: AO Fault mode**

This object defines, whether an output is set to a pre-defined error value (see Object x341h: AO Fault FV) in case of an internal device failure.

- 0 – actual value rest
- 1 – reverts to error value (see Object x341h: AO Fault FV)
- other – reserved

## OBJECT DESCRIPTION

Index	6340h
Name	<b>AO Fault mode</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	0

## 7.2.62 Object x400h: CO Effective Current Value Xeff

This object defines the effective current value used by the control algorithm. The physical unit and the number of decimal digits of this object are defined by objects 6406h and 6407h.

### OBJECT DESCRIPTION

Index	x400h
Name	CO Effective Current Value Xeff
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Mandatory

### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h

to

Sub-Index	C7h
Description	CO Effective Current Value 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	data type specific
Default Value	No

### 7.2.63 Object x401h: CO Effective Set Point Weff

This object holds the set point currently used by the controller algorithm. In most cases it will be a copy of the objects x402h or x403h (it may be generated by set point ramp also). The physical unit and the number of decimal digits of this object are defined by objects 6406h and 6407h.

#### OBJECT DESCRIPTION

Index	x401h
Name	CO Effective Set Point Weff
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h

Description	Effective Set Point Weff 199
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	data type specific
Default Value	No

### 7.2.64 Object x402h: CO Set point W

The first set point is variable within the limits of W0 and W100 ( $W0 \leq W \leq W100$ ). The physical unit and the number of decimal digits of this object are defined by objects 6406h and 6407h.

#### OBJECT DESCRIPTION

Index	x402h
Name	CO Set point W
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h

### 7.2.71 Object 6411h: CO Differential Controller Output Ydiff

This object holds differential controller output calculated by the PID algorithm. The object is read only. The value is given in percent with one decimal digit after the comma (see Object 6410h: CO Effective Controller Output Y). The value will always be within the range of Ymin and Ymax ( $Y_{diff} < (Y_{max} - Y_{min})$ ).

#### OBJECT DESCRIPTION

### 7.2.72 Object 6412h: CO Manual Controller Output

The value is used as output in the manual controller mode. The value is given in percent with one decimal digit after the comma (see Object 6410h: CO Effective Controller Output Y).

#### OBJECT DESCRIPTION

Index	6412h
Name	Manual Controller Output
Object Code	ARRAY
Data Type	Unsigned16
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Manual Controller Output 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	0

Sub-Index	2h
Description	Manual Controller Output 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	0

to

Sub-Index	C7h
Description	Manual Controller Output 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	0

### 7.2.73 Object 6413h: CO Lower Controller Output Limit Ymin

The value describes the lower limit for the controller output. The value is given in percent with one decimal digit after the comma (see Object 6410h: CO Effective Controller Output Y).

#### OBJECT DESCRIPTION

Index	6413h
Name	Lower Controller Output Limit Ymin
Object Code	ARRAY
Data Type	Unsigned16
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Lower Controller Output Limit 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	No

Sub-Index	2h
Description	CO Lower Controller Output Limit 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	No

to

Sub-Index	C7h
Description	CO Lower Controller Output Limit 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	No

#### 7.2.74 Object 6414h: CO Upper Controller Output Limit Ymax

The value describes the lower limit for the controller output. The value is given in percent with one decimal digit after the comma (see Object 6410h: CO Effective Controller Output Y).

##### OBJECT DESCRIPTION

Index	6414h
Name	Upper Controller Output Limit Ymax
Object Code	ARRAY
Data Type	Unsigned16
Category	Optional

##### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Upper Controller Output Limit 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	No

Sub-Index	2h
Description	CO Upper Controller Output Limit 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	No

to

Sub-Index	C7h
Description	CO Upper Controller Output Limit 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0000h – 03E8h, FC18h - FFFFh
Default Value	No

### 7.2.75 Object 6415h: CO Physical Unit Controller Output

The object describes the physical unit of the objects beginning from 6410h to 6414h (see Object 6131h: AI Physical unit PV).

#### OBJECT DESCRIPTION

Index	6415h
Name	CO Physical Unit Controller Output
Object Code	ARRAY
Data Type	Unsigned32
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Physical Unit Controller Output 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

Sub-Index	2h
Description	CO Physical Unit Controller Output 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

to

Sub-Index	C7h
Description	CO Physical Unit Controller Output 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

### 7.2.76 Object 6420h: CO Set Point switch W/W2

Set Point Switch W/W2 for switching between first and second set point.

FALSE – selects the first set point

TRUE – selects the second set point

#### OBJECT DESCRIPTION

Index	6420h
Name	Set Point Switch W/W2
Object Code	ARRAY
Data Type	Boolean
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Set Point Switch 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

Sub-Index	2h
Description	Set Point Switch 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

to

Sub-Index	C7h
Description	Set Point Switch 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

### 7.2.77 Object 6421h: CO Automatic/Manual Mode switch A/M

Switches between automatic and manual mode.

FALSE – selects the automatic mode

TRUE – selects the manual mode

#### OBJECT DESCRIPTION

Index	6421h
Name	Automatic Manual Mode A/M
Object Code	ARRAY
Data Type	Boolean
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Automatic Manual Mode 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

Sub-Index	2h
Description	Automatic Manual Mode 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

to

Sub-Index	C7h
Description	Automatic Manual Mode 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

### 7.2.78 Object 6422h: CO Controller On/Off

Switches the controller on or off.

TRUE – switches the controller on

FALSE – switches the controller off

#### OBJECT DESCRIPTION

Index	6412h
Name	Controller On/ Off
Object Code	ARRAY
Data Type	Boolean
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Controller On /Off 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

Sub-Index	2h
Description	Controller On/ Off 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

to

Sub-Index	C7h
Description	Controller On /Off 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

### 7.2.79 Object 6423h: CO Controller mode

Selects the mode of the controller. The meaning is shown below.

control byte	Mode
00h	2-point controller
01h	3-point controller
02h	3-point stepping controller
03h	continuos controller
04h	reserved for future use
⋮	⋮
7Fh	reserved for future use
80h	manufacturer specific controller type
⋮	⋮
FFh	manufacturer specific controller type

#### OBJECT DESCRIPTION

Index	6423h
Name	Controller Mode
Object Code	ARRAY
Data Type	Unsigned8
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Controller Mode 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	Controller Mode 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	Controller Mode 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.80 Object 6424h: CO Self Optimization on/off

This object switches the self-optimisation mode on or off.

FALSE – switches the self-optimisation off

TRUE – switches the self-optimisation on

#### OBJECT DESCRIPTION

Index	6424h
Name	CO Self Optimisation On/Off
Object Code	ARRAY
Data Type	Boolean
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Self Optimization 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

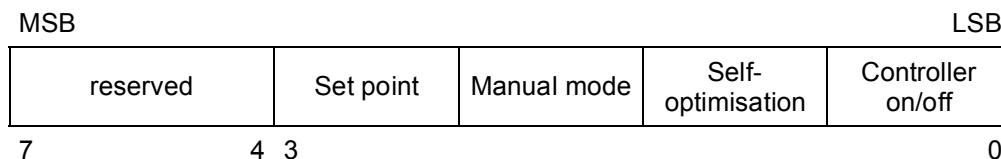

Sub-Index	2h
Description	CO Self Optimization 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

to

Sub-Index	C7h
Description	CO Self Optimization 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Boolean
Default Value	FALSE

### 7.2.81 Object 6425h: CO Control Byte

The control byte maps the objects for set-point switch, controller on/off etc. in one single object. The main purpose for this mapping is to have a single object for the PDO mapping.

Value	Meaning
0	disable function
1	enable function

#### OBJECT DESCRIPTION

Index	6425h
Name	CO Control Byte
Object Code	ARRAY
Data Type	Unsigned8
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Control Byte 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

Sub-Index	2h
Description	CO Control Byte 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

to

Sub-Index	C7h
Description	CO Control Byte 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

### 7.2.82 Object 6426h: CO Control byte enable

This bit mask enables the single bits within the CO Control byte.

#### OBJECT DESCRIPTION

Index	6426h
Name	CO Control Byte Enable
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Control Byte Enable 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	CO Control Byte Enable 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	CO Control Byte Enable 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	No

### 7.2.83 Object 6427h: CO Status Word

The status word holds the status of the controller. The main purpose for this object is to have a single object for the PDO mapping.

The single bits of the CO status information have the following meaning:

MSB	15	11	10	9	8	7	5	4	3	2	1	0	LSB
reserved	Net over-load	Over-load	Data not valid	reserved	Optimisation error	Set point	Manual mode	Self-optimisation	Controller on/off				

Value	Meaning
0	not valid (Not occurred)
1	valid (occurred)

This object is read-only. Although this object is nearly a copy of the object 6425h, it may hold a different value. If, for example, the user wants to switch a controller on, the value TRUE is written to object 6422h. The corresponding bit will be set in object 6425h. However the specified control zone may not switched on due to a error, so bit 0 in object 6427h will Not change to 1.

#### OBJECT DESCRIPTION

Index	6427h
Name	CO Status Word
Object Code	ARRAY
Data Type	Unsigned16
Category	Mandatory

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Status Word 1
Entry Category	Mandatory

Default Value	No

to

Sub-Index	C7h
Description	CO Status Word 199
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	0 - FFFFH
Default Value	No

### 7.2.84 Object x430h: CO Minimum Pulse Time Tmin1

The physical unit of this object is seconds. The number of decimal digits of this object is defined by object 6434h.

#### OBJECT DESCRIPTION

Index	x430h
Name	Minimum Pulse Time Tmin1
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Minimum Pulse Time Tmin1 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

Sub-Index	2h
Description	Minimum Pulse Time Tmin1 2
Entry Category	Optional

### 7.2.97 Object x451h: CO Proportional Band Xp2

The object describes the parameter Xp of the PID-algorithm. The value is given in percent with one digit after the comma (see Object 6410h: CO Effective Controller Output Y for representation as Integer16).

#### OBJECT DESCRIPTION

Index	x451h
Name	CO Proportional Band Xp2
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Proportional Band Xp2 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

Sub-Index	2h
Description	CO Proportional Band Xp2 2
Entry Category	Optional
Access	rw

Value Range	data type specific
Default Value	No

to

Sub-Index	C7h
Description	CO Proportional Band Xp2 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.98 Object x452h: CO Integral Action Time Tn1

The object describes the parameter Tn of the PID-algorithm. The physical unit and the number of decimal digits is given by objects 6458h and 6459h.

#### OBJECT DESCRIPTION

Index	x452h
Name	CO Integral Action Time Tn1
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Integral Action Time Tn1 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

Sub-Index	2h
Description	CO Integral Action Time Tn1 2
Entry Category	Optional
Access	rw

Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.103 Object x457h: CO Cycle Time T2

The object describes the cycle time of the PID-algorithm. The physical unit and the number of decimal digits is given by objects 6458h and 6459h.

#### OBJECT DESCRIPTION

Index	x457h
Name	CO Cycle Time T2
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Cycle Time T2 1
Entry Category	Mandatory

PDO Mapping	No
Value Range	data type specific
Default Value	No

to

Sub-Index	C7h
Description	CO Cycle Time T2 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.104 Object 6458h: CO Physical Unit PID Timing

The object describes the physical unit of the objects beginning from x450h to x457h (see Object 6131h: AI Physical unit PV).

#### OBJECT DESCRIPTION

Index	6458h
Name	CO Physical Unit PID
Object Code	ARRAY
Data Type	Unsigned32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Physical Unit PID 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	0003 0000h

Sub-Index	2h
Description	CO Physical Unit PID 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	0003 0000h

to

Sub-Index	C7h
Description	CO Physical Unit PID 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	0003 0000h

### 7.2.105 Object 6459h: CO Decimal Digits PID Timing

The object describes the number of decimal digits of the objects beginning from x450h to x457h.

#### OBJECT DESCRIPTION

Index	6459h
Name	CO Decimal Digits PID
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	CO Decimal Digits PID 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	0 - 15
Default Value	No

Sub-Index	2h
Description	CO Decimal Digits PID 2
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 - 15
Default Value	No

to

Sub-Index	C7h
Description	CO Decimal Digits PID 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 - 15
Default Value	No

### 7.2.106 Object x500h: AL 1 Input value

This object represents the process value, which is the input to the alarm function block.

It is scaled in the physical unit of process values (e.g. degrees centigrade, kg, kN, mm etc.).

#### OBJECT DESCRIPTION

Index	x500h
Name	<b>AL 1 Input value</b>
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	<b>AL 1 Input value 1</b>
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	data type specific
Default Value	No

Sub-Index	2h
Description	<b>AL 1 Input value 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	data type specific
Default Value	No

to

Sub-Index	C7h
Description	<b>AL 1 Input value 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	data type specific
Default Value	No

### 7.2.107 Object 6503h: AL 1 Link input

This object describes the source for the AL Input Value if it lies within another functional block of the same device. The object defined by index and sub-index is directly linked to the AL Input Value.

#### OBJECT DESCRIPTION

Index	6503h
Name	<b>AL 1 Link input</b>
Object Code	RECORD
Data Type	PDOmapping
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 – C7h
Default Value	No

Sub-Index	1h
Description	<b>AL 1 Link input 1</b>
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

Sub-Index	2h
Description	<b>AL 1 Link input 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

to

Sub-Index	C7h
Description	<b>AL 1 Link input 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned32
Default Value	No

### 7.2.108 Object x504h: AL 1 Alternate input value

This object represents the process value, which is the alternate input to the alarm function block. This alternate input is only used if functionality needs two input values.

It is scaled in the physical unit of process values (e.g. degrees centigrade, kg, kN, mm etc.).

#### OBJECT DESCRIPTION

Index	x504h
Name	AL 1 Alternate input value
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AL 1 Alternate input value 1
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

Sub-Index	2h
Description	AL 1 Alternate input value 2
Entry Category	Optional
Access	rw
PDO Mapping	No

Default Value	No

to

Sub-Index	C7h
Description	AL 1 Alternate input value 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	No

### 7.2.109 Object 6505h: AL 1 Link alternate input

This object describes the source for the AL Input Value if it lies within another functional block of the same device. The object defined by index and sub-index is directly linked to the AL Input Value.

#### OBJECT DESCRIPTION

Index	6505H
Name	<b>AL 1 Link alternate input</b>
Object Code	RECORD
Data Type	PDOMapping
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 – C7h
Default Value	No

Sub-Index	1h
Description	<b>AL 1 Link alternate input 1</b>
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	0 – 9h
Default Value	No

Sub-Index	2h
Description	<b>AL 1 Link alternate input 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 – 9h
Default Value	No

to

Sub-Index	C7h
Description	<b>AL 1 Link alternate input 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 – 9h
Default Value	No

### 7.2.110 Object 6506h: AL 1 Fault mode

A value of 0 specifies that the state of output AL 1 is not changed in case of a fault condition. If value is 1 then AL 1 Fault State is output of AL 1 state if there is a fault condition.

#### OBJECT DESCRIPTION

Index	6506h
Name	<b>AL 1 Fault mode</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	<b>AL 1 Fault mode 1</b>
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	0 – 1h
Default Value	1h

Sub-Index	2h
Description	<b>AL 1 Fault mode 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 – 1h
Default Value	1h

to

Sub-Index	199
Description	<b>AL 1 Fault mode 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	0 – 1h
Default Value	1h

### 7.2.111 Object 6507h: AL 1 Fault state

State of Alarm output, if there is a fault condition and AL 1 Fault Mode is 1.

#### OBJECT DESCRIPTION

Index	6507h
Name	<b>AL 1 Fault state</b>
Object Code	ARRAY
Data Type	Boolean
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	<b>AL 1 Fault state 1</b>
Entry Category	Mandatory
Access	rw
PDO Mapping	No
Value Range	Boolean
Default Value	FALSE

Sub-Index	2h
Description	<b>AL 1 Fault state 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Boolean
Default Value	FALSE

to

Sub-Index	C7h
Description	<b>AL 1 Fault state 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Boolean
Default Value	FALSE

### 7.2.112 Object 6508h: AL 1 Type

This object specifies the alarm type.

Value	Meaning
0h	No Alarm Function
1h	Sensor Fault
2h	above or equal

Value	Meaning
3h	Below
4h	Difference (input - alternate input) above
5h	Difference below
6h	in window (including boarders)
7h	out of window (excluding boarders)
8h	reserved
...	...
11h	reserved
12h	above with starting condition
13h	below with starting condition
14h	Difference above with starting condition
15h	Difference below with starting condition
16h	in window with starting condition
17h	out of window with starting condition
18h	reserved
...	...
FFh	reserved

## OBJECT DESCRIPTION

Index	6508h

Description	AL 1 Type 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

### 7.2.113 Object 6509h: AL 1 Action

This object defines which actions are performed, if the alarm state is changing.

Objects 6519h, 6529h ... 65F9h are similar defined.

MSB	LSB				
reserved	4	3	2	1	0
15					

Value	Meaning
0	not valid
1	valid

#### OBJECT DESCRIPTION

Index	6509h
Name	AL 1 Action
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h

to

Sub-Index	C7h
Description	AL 1 Action 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	Unsigned8
Default Value	0

### 7.2.114 Object x50Ah: AL 1 Level

This object represents the level, which the AL Input Value is compared with. It is scaled in the physical unit of process values (e.g. degrees centigrade, kg, kN, mm etc.). If alarm type is "window" then this object represents the lower limit of the window.

Objects x51Ah, x52Ah ... x5FAh are defined similar.

#### OBJECT DESCRIPTION

Index	x50Ah
Name	AL 1 Level
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h

to

Sub-Index	C7h
Description	AL 1 Level 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	0

### 7.2.115 Object x50Bh: AL 1 Hysteresis

This object represents the hysteresis, which is used for the comparison of AL Input Value and AL Level. It helps the AL State not to alter too fast when AL Input Values are noisy. Hysteresis is scaled in the physical unit of process values (e.g. degrees centigrade, kg, kN, mm etc.). If alarm type is "window" then this object specifies the width of the window.

Objects x51Bh, x52Bh ... x5FBh are defined similar.

#### OBJECT DESCRIPTION

Index	x50Bh
Name	AL 1 Hysteresis
Object Code	ARRAY
Data Type	Float, Integer16, Integer24, Integer32
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro

to

Sub-Index	C7h
Description	AL 1 Hysteresis 199
Entry Category	Optional
Access	rw
PDO Mapping	No
Value Range	data type specific
Default Value	1

### 7.2.116 Object 650Ch: AL 1 Group

Alarm Outputs can be grouped together, that multiple alarms are grouped to a single AL Group State bit. A maximum of 8 groups can be defined. A value of 0 means, that the alarm state is not tied to a alarm group.

Objects 651Ch, 652Ch ... 65FCh are defined similar.

#### OBJECT DESCRIPTION

Index	650Ch
Name	AL 1 Group
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory

Description	AL 9..16 State 1
Entry Category	Mandatory
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	AL 9..16 State 2
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	AL 9..16 State 199
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

**7.2.121 Object 6602h: AL General state**

Logical OR-result of all alarm states of all alarm channels.

## OBJECT DESCRIPTION

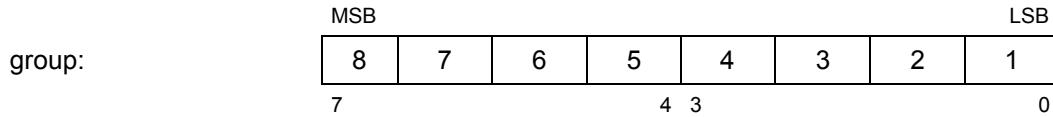

Index	6602
Name	AL General state
Object Code	VAR
Data Type	Boolean
Category	Optional

## ENTRY DESCRIPTION

Access	ro
PDO Mapping	Possible
Value Range	Boolean
Default Value	No

**7.2.122 Object 6603h: AL Group 1..8 State**

A single bit in the group alarm state is set to one if at least one of the alarms tied to this group is true.

Value	Meaning
0	not occurred
1	occurred

## OBJECT DESCRIPTION

Index	6603h
Name	AL Group 1..8 State
Object Code	VAR
Data Type	Unsigned8
Category	Optional

## ENTRY DESCRIPTION

Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

**7.2.123 Object 6610h: AL General Reset**

This write only object resets all alarms of all channels within the unit which is important, if hysteresis or starting conditions are defined.

## OBJECT DESCRIPTION

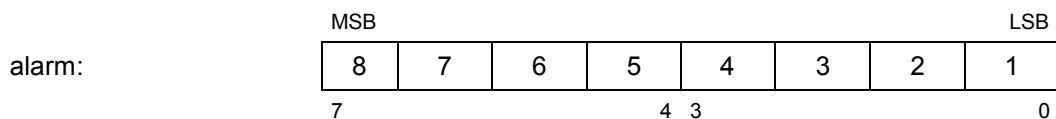

Index	6610h
Name	AL General Reset
Object Code	VAR
Data Type	Boolean
Category	Optional

## OBJECT DESCRIPTION

Access	wo
PDO Mapping	Possible
Value Range	Boolean
Default Value	No

**7.2.124 Object 6611h: AL 1..8 Reset**

Alarm reset bits of alarm 1 to 8 grouped together within one byte.

Value	Meaning
0	do not perform reset
1	perform reset

## OBJECT DESCRIPTION

Index	6611h
Name	AL 1..8 Reset
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

## ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AL 1..8 Reset 1
Entry Category	Mandatory
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

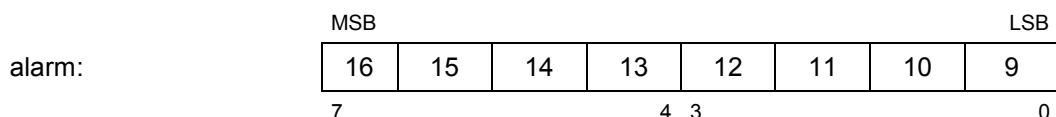

Sub-Index	2h
Description	AL 1..8 Reset 2
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	AL 1..8 Reset 199
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.125 Object 6612h: AL 9..16 Reset

Alarm reset bits of alarm 9 to 16 grouped together within in byte.

Value	Meaning
0	do not perform reset
1	perform reset

#### OBJECT DESCRIPTION

Index	6612h
Name	AL 9..16 Reset
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	AL 9..16 Reset 1
Entry Category	Mandatory
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	AL 9..16 Reset 2
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	AL 9..16 Reset 199
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.126 Object 6F20h: Life counter

The life counter is incremented in a manufacturer specific way to make sure for a receiver of PDO data that the system is still alive and is producing new values.

#### OBJECT DESCRIPTION

Index	6F20h
Name	<b>Life counter</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of valid entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	0 - C7h
Default Value	No

Sub-Index	1h
Description	<b>Life counter 1</b>
Entry Category	Mandatory
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

Sub-Index	2h
Description	<b>Life counter 2</b>
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

to

Sub-Index	C7h
Description	<b>Life counter 199</b>
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	0

### 7.2.127 Object 6F30h: Receive PDO check

This object defines check-bytes for receive PDOs 1 to n. If mapped into a receive PDO, the check-byte is copied from the receive PDO to the data object each time the PDO is received and can be evaluated by the application. The algorithm for calculating the check-byte is manufacturer specific.

#### OBJECT DESCRIPTION

Index	6F30h
Name	<b>Receive PDO check</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of valid entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	0 – 10h
Default Value	No

Sub-Index	1h
Description	rPDO 1 Check
Entry Category	Mandatory
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	rPDO 2 Check
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	10h
Description	rPDO 16 Check
Entry Category	Optional
Access	wo
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.128 Object 6F31h: Transmit PDO check

This object defines check-bytes for transmit PDOs 1 to n. If mapped into a transmit PDO, the check-byte is calculated and copied to the transmit PDO each time the PDO is transmitted. The algorithm for calculating the check-byte is manufacturer specific.

#### OBJECT DESCRIPTION

Index	6F30h
Name	<b>Transmit PDO check</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of valid entries
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	0 – 10h
Default Value	No

Sub-Index	1h
Description	tPDO 1 Check
Entry Category	Mandatory
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	tPDO 2 Check
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	10h
Description	tPDO 16 Check
Entry Category	Optional
Access	ro
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.129 Object xF50h: Received PV

General input process value, which is used as input for analogue output (output process value), controller (effective current value) or alarm (input value for alarm 1..16) function block depending on type of module.

#### OBJECT DESCRIPTION

Index	xF50h
Name	Received PV
Object Code	ARRAY
Data Type	specified by index
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of channels
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Received PV 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	Received PV 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	Received PV 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.130 Object xF51h: Alternate received PV

Alternate input process value, which is used as input for alarm (alternate input value for alarm 1..16) function block.

#### OBJECT DESCRIPTION

Index	xF51h
Name	Alternate received PV
Object Code	ARRAY
Data Type	specified by index
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of channels
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	Alternate received PV 1
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	Alternate received PV 2
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	Alternate received PV 199
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.131 Object 6F52h: Received status

General input status value which is used as input for analogue output (output process value), controller (effective current value) or alarm (input value for alarm 1..16) function block depending on type of module. This status byte will make sure that input process values are only used in these functional blocks when they are valid.

#### OBJECT DESCRIPTION

Index	6F52h
Name	<b>Received status</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Mandatory

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of channels
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	<b>Received status 1</b>
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	<b>Received status 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	<b>Received status 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.132 Object 6F53h: Alternate received status

General input status value, which is used as alternate input for analogue output (output process value), controller (effective current value) or alarm (input value for alarm 1..16) function block depending on type of module. This status byte will make sure that alternate input process values are only used in these functional blocks when they are valid.

#### OBJECT DESCRIPTION

Index	6F53h
Name	<b>Alternate received status</b>
Object Code	ARRAY
Data Type	Unsigned8
Category	Optional

#### ENTRY DESCRIPTION

Sub-Index	0h
Description	number of channels
Entry Category	Mandatory
Access	ro
PDO Mapping	No
Value Range	1 - C7h
Default Value	No

Sub-Index	1h
Description	<b>Alternate received status 1</b>
Entry Category	Mandatory
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

Sub-Index	2h
Description	<b>Alternate received status 2</b>
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

to

Sub-Index	C7h
Description	<b>Alternate received status 199</b>
Entry Category	Optional
Access	rw
PDO Mapping	Possible
Value Range	Unsigned8
Default Value	No

### 7.2.133 Object 6F60h: Transmission Enable

This object enables transmission of PDOs when a transmission event is detected. This object may be used to make sure that all receiving modules are ready within the operational state before PDOs are transmitted within the bus.

#### OBJECT DESCRIPTION

Index	6F60h
Name	Transmission Enable
Object Code	VAR
Data Type	Boolean
Category	Optional

#### ENTRY DESCRIPTION

Access	rw
PDO Mapping	No
Value Range	Boolean
Default Value	FALSE
