## General information on licensing and patents

CAN in AUTOMATION (CiA) calls attention to the possibility that some of the elements of this CiA specification may be subject of patent rights. CiA shall not be responsible for identifying any or all such patent rights.

Because this specification is licensed free of charge, there is no warranty for this specification, to the extent permitted by applicable law. Except when otherwise stated in writing the copyright holder and/or other parties provide this specification "as is" without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The entire risk as to the correctness and completeness of the specification is with you. Should this specification prove failures, you assume the cost of all necessary servicing, repair or correction.

## Trademarks

CANopen® and CiA® are registered community trademarks of CAN in Automation. The use is restricted for CiA members or owners of CANopen vendor ID. More detailed terms for the use are available from CiA.

## 1 Scope

This device profile describes a recommended practice for the communication link between a battery module and a battery charger. The required data messages are intended to be sufficient to allow a battery charge to be carried out. Optional data is a selection of data commonly used in the industry to provide enhanced features. Battery modules compliant to this standard shall use communication techniques, which conforms to those described in the CANopen application layer and communication profile.

### 3 Abbreviations and definitions

#### 3.1 Abbreviations

|        |                                 |
|--------|---------------------------------|
| CAN    | Controller area network         |
| CAN-ID | CAN identifier                  |
| COB-ID | Communication object identifier |
| PDO    | Process data object             |
| RPDO   | Receive process data object     |
| SDO    | Service data object             |
| TPDO   | Transmit process data object    |

#### 3.2 Definitions

The definitions given in /CiA301/ apply to this specification, too.

## 4 Operating principles

### 4.1 General

The purpose of the battery module is to provide information to a charger sufficient to allow a charge to be carried out. The minimum information required is the battery type, battery capacity, number of cells, maximum charge current permissible, and the battery temperature. All devices conforming to this specification shall provide this information in the manner described. Additional, optional information, such as various identifiers, charge history data, battery voltage, battery state of charge, requested current and water level status are also defined. Conforming devices need not supply this information, but if they do, they shall provide it in the manner described herein.

A default TPDO is defined to send the battery temperature and status information on a timer driven basis. Optional TPDOs are defined for transmitting battery voltage, current requests and state of charge. A default RPDO is defined to receive charger status. An optional RPDO adds charge returned to the data received. Battery parameter information may be read by SDO services. If the charger supports any of the optional data items, these may be read by SDO services. If the module supports the optional PDOs, then they can be configured via SDO services.

The battery module shall support the heartbeat function, and may optionally be a time-stamp consumer.

### 4.2 Physical layer

#### 4.2.1 Connector

The battery module shall have a 5-wire interconnect. The communications bus shall use three of these lines (CAN\_L, CAN\_H, and ground), and two shall be used for the pilot signal (see appendix B). The actual connector used and its pin configuration will vary depending on the battery's application, and thus is outside of the scope of this document.

#### 4.2.2 CAN transceiver

The CAN bus shall use standard high-speed differential transceivers compliant to /ISO11898-2/. The battery module shall support at least the 125 kbit/s default bit-rate. A termination resistor of 124 Ohm shall be included in the default battery module configuration.

## 5 Error handling

### 5.1 Principle

Emergency messages are triggered by internal errors in the device, and are assigned the highest possible priority to minimize latency on access to the bus. The emergency message contains the emergency error code, and the error register object /CiA301/. Additional data bytes are included in the message, which may be used for manufacturer specific information.

### 5.2 Error behavior

If a serious device failure is detected, the module shall enter the pre-operational state by default. If object 1029<sub>h</sub> is implemented, the module may be configured to enter the stopped state or remain in the current state as alternatives. Device failures shall include the following communication errors:

- CAN bus-off condition
- Heartbeat event with the state 'occurred'

Device failure may also be caused by internal module failures, e.g. missing the pilot signal.

### 5.3 Additional error code meanings

The CANopen standard error codes are given in /CiA301/. Additional error codes specific to the battery module are given in Table 1.

**Table 1: Additional error codes**

| Error code        | Meaning                  |
|-------------------|--------------------------|
| 5010 <sub>h</sub> | temperature sensor fault |

## 6 Communication object definitions

### 6.1 Introduction

One default RPDO and one default TPDO are defined. All modules compliant to this device profile shall support these PDOs, which transmit battery status and battery temperature from the battery module, and receive charger status from the charger. Two optional RPDOs and one optional TPDO are defined as alternate PDO formats. These PDOs shall contain additional data (battery voltage in the TPDO, and Ah returned and state of charge in the RPDOs), and, if supported by a module, they may be enabled via SDO services, and the default PDO disabled. One additional optional TPDO is defined for transmitting optional information (current requested and state of charge).

Modules compliant with this device profile shall have default values for some communication objects ( $1000_h$  to  $1FFF_h$ ), which are not fully specified in /CiA301/.

### 6.2 Detailed object definitions

#### 6.2.1 Object $1000_h$ : Device type

This object describes the battery module's functionality.

##### VALUE DEFINITION

|                               |    |    |                              |
|-------------------------------|----|----|------------------------------|
| 31                            | 16 | 15 | 0                            |
| <i>Additional information</i> |    |    | <i>Device profile number</i> |
| MSB                           |    |    | LSB                          |

*Device profile number:*  $418_d$

*Additional information:* Bits 16 through 19 shall be used to indicate support for optional features. The other bits are reserved (and shall read as 0). Table 2 shows the optional features associated with each bit. The bits shall be 1 if the feature is supported, and shall be 0 if they are not supported.

**Table 2: Support of optional PDOs**

| Bit      | Optional feature     |
|----------|----------------------|
| 16       | 2 <sup>nd</sup> RPDO |
| 17       | 3 <sup>rd</sup> RPDO |
| 18       | 2 <sup>nd</sup> TPDO |
| 19       | 3 <sup>rd</sup> TPDO |
| 20 to 31 | reserved             |

##### OBJECT DESCRIPTION

See /CiA301/.

##### ENTRY DESCRIPTION

See /CiA301/.

#### 6.2.2 Object $1001_h$ : Error register

The device specific bit of the error register shall indicate a temperature sensor fault.

#### 6.2.3 1<sup>st</sup> RPDO

##### 6.2.3.1 General

This RPDO shall be received asynchronously. The mapped objects shall be updated immediately after successful RPDO reception.

### 6.2.3.2 Object 1400<sub>h</sub>: Communication parameter

#### VALUE DEFINITION

See /CiA301/.

#### OBJECT DESCRIPTION

|             |                   |
|-------------|-------------------|
| INDEX       | 1400 <sub>h</sub> |

### 6.2.4 1<sup>st</sup> TPDO

#### 6.2.4.1 General

The battery module shall transmit periodically status and temperature information, if this TPDO has been enabled. The data shall be updated before transmission regardless of whether the transmission is triggered by the event timer or by CAN remote frame. (Note: Do not use CAN implementations, which respond to remote frames automatically).

**6.2.6 2<sup>nd</sup> TPDO****6.2.6.1 General**

This TPDO is an optional substitute for the 1<sup>st</sup> TPDO, and adds the battery voltage to the transmission of the temperature and status. If the module supports this TPDO, the charger may disable the 1<sup>st</sup> TPDO and enable this one if desired. The data shall be updated before transmission regardless of whether the transmission is triggered by the event timer or by CAN remote frame. (*Note:* Do not use CAN implementations, which respond to remote frames automatically).

**6.2.6.2 Object 1801<sub>h</sub>: Communication parameter****VALUE DEFINITION**

| PDO mapping    | No                       |
| Value range    | see /CiA301/             |
| Default value  | 6080 00 08 <sub>h</sub>  |

**6.2.8 3<sup>rd</sup> TPDO****6.2.8.1 General**

This TPDO is an optional additional object with which the module can transmit a requested current value and the battery-state of charge to the charger. The data shall be updated before transmission regardless of whether the transmission is triggered by the event timer or by CAN remote frame. (*Note:* Do not use CAN implementations, which respond to remote frames automatically).

### 6.2.8.2 Object 1802<sub>h</sub>: Communication parameter

#### VALUE DEFINITION

See /CiA301/.

#### OBJECT DESCRIPTION

|             |   |
|-------------|---|
| INDEX       | 1802 <sub>h</sub>                                   |
| Name        | TPDO parameter                                      |
| Object code | RECORD  |
| Data type   | PDO CommPar   |
| Category    | Conditional: Bit 19 = 1 in object 1000 <sub>h</sub> |

#### ENTRY DESCRIPTION

|                |                             |
|----------------|-----------------------------|
| Sub-index      | 00 <sub>h</sub>             |
| Description    | highest sub-index supported |
| Entry category | Mandatory                   |
| Access         | ro                          |
| PDO mapping    | No                          |
| Value range    | see /CiA301/                |
| Default value  | 05 <sub>h</sub>             |

| Access         | ro                       |
| PDO mapping    | No                       |
| Value range    | see /CiA301/             |
| Default value  | 6070 00 10 <sub>h</sub>  |

|                |                         |
|----------------|-------------------------|
| Sub-index      | 02 <sub>h</sub>         |
| Description    | battery state of charge |
| Entry category | Mandatory               |
| Access         | ro                      |
| PDO mapping    | No                      |
| Value range    | see /CiA301/            |
| Default value  | 6081 00 08 <sub>h</sub> |

## 7 Application object definitions

### 7.1 Introduction

*Object description and entry description* attributes are specified in /CiA301/. The *default value* attribute defines the value of an object with access attribute of the value ‘rw’ and ‘wo’ after power-on or application reset.

Detailed object specifications are given in the following sections.

### 7.2 Complex data type definition

#### 7.2.1 Record 0080<sub>h</sub>: BatteryPar

Sub-index 1: *Battery type*

Generic description of the battery chemistry and configuration. Refer to *appendix A* for details.

Sub-index 2: *Ah capacity*

Nominal energy capacity in Ampere-hours as provided by the battery manufacturer.

Sub-index 3: *Maximum charge current*

Maximum current in Amperes that is safely delivered to the battery without causing physical damage to the battery or its interconnecting straps or cables.

Sub-index 4: *Number of cells*

Number of battery cells that make up the battery pack.

| Index             | Sub-index       | BatteryPar record           | Data type  |
|-------------------|-----------------|-----------------------------|------------|
| 0080 <sub>h</sub> | 00 <sub>h</sub> | Highest sub-index supported | Unsigned8  |
|                   | 01 <sub>h</sub> | Battery type                | Unsigned8  |
|                   | 02 <sub>h</sub> | Ah capacity                 | Unsigned16 |
|                   | 03 <sub>h</sub> | Maximum charge current      | Unsigned16 |
|                   | 04 <sub>h</sub> | Number of cells             | Unsigned16 |

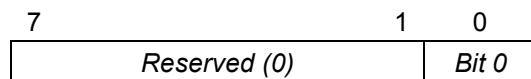

### 7.3 Detailed object definitions

#### 7.3.1 Object 6000<sub>h</sub>: Battery status

This object shall provide the status of the battery, which indicates the readiness of the battery to accept a charge or not.

#### VALUE DEFINITION

The status byte shall have the following format:

|     |   |     |
|-----|---|-----|
| 7   | 1 | 0   |
| MSB |   | LSB |

*Bit 0:* 0 = not ready

1 = ready

#### OBJECT DESCRIPTION

|             |                   |
|-------------|-------------------|
| INDEX       | 6000 <sub>h</sub> |
| Name        | battery status    |
| Object code | VAR               |
| Data type   | Unsigned8         |
| Category    | Mandatory         |

#### ENTRY DESCRIPTION

|               |                      |
|---------------|----------------------|
| Sub-index     | 00 <sub>h</sub>      |
| Access        | ro                   |
| PDO mapping   | Default              |
| Value range   | see value definition |
| Default value | No                   |

#### 7.3.2 Object 6001<sub>h</sub>: Charger status

This object shall indicate readiness of the charger to deliver a charge to the battery—i.e., ready or not-ready

#### VALUE DEFINITION

The status byte shall have the following format:

|     |   |     |
|-----|---|-----|
| 7   | 1 | 0   |
| MSB |   | LSB |

*Bit 0:* 0 = not ready

1 = ready

#### OBJECT DESCRIPTION

| Object code | VAR               |
| Data type   | Unsigned8         |
| Category    | Mandatory         |

#### ENTRY DESCRIPTION

|               |                      |
|---------------|----------------------|
| Sub-index     | 00 <sub>h</sub>      |
| Access        | rw                   |
| PDO mapping   | Default              |
| Value range   | see value definition |
| Default value | 00 <sub>h</sub>      |

### 7.3.3 Object 6010<sub>h</sub>: Temperature

This object shall provide the temperature of the battery pack as measured by a temperature reading device physically mounted somewhere on the battery module.

#### VALUE DEFINITION

Temperature shall be given in °C with resolution 0.125 °C per bit. The minimum range of values shall be -320 to +680 (i.e. -40.0 °C to +85.0 °C).

#### OBJECT DESCRIPTION

|             |                   |

| Value range    | Unsigned16      |
| Default value  | No              |

### 7.3.5 Object 6030<sub>h</sub>: Battery serial number

This object shall provide a character string (numeric or alphanumeric) associated with a battery pack, usually applied by the battery manufacturer. The battery serial number may not be unique across the entire population of batteries. Maximum number of characters shall be 10. Character strings in the battery module shall be packed into Unsigned32 objects to allow them to be transferred using expedited SDO services.

## VALUE DEFINITION

*Example:* The character string "BATTERY" (7-bit coded representation /ISO646/: 42 41 54 54 45 52 59) is packed as follows:

|                             |          |
|-----------------------------|----------|
| Sub-index 00 <sub>h</sub> : | 2        |
| Sub-index 01 <sub>h</sub> : | 54544142 |
| Sub-index 02 <sub>h</sub> : | 00595245 |

## OBJECT DESCRIPTION

|             |                       |
|-------------|-----------------------|
| Index       | 6030 <sub>h</sub>     |
| Name        | battery serial number |
| Object code | ARRAY                 |
| Data type   | Unsigned32            |
| Category    | Optional              |

## ENTRY DESCRIPTION

|                |                                    |
|----------------|------------------------------------|
| Sub-index      | 00 <sub>h</sub>                    |
| Description    | number of elements                 |
| Entry category | Mandatory                          |
| Access         | ro                                 |
| PDO mapping    | No                                 |
| Value range    | 01 <sub>h</sub> to 03 <sub>h</sub> |
| Default value  | No                                 |

|                |                                |
|----------------|--------------------------------|
| Sub-index      | 01 <sub>h</sub>                |
| Description    | packed ASCII characters 1 to 4 |
| Entry category | Mandatory                      |
| Access         | ro                             |

| Value range    | Unsigned32                       |
| Default value  | No                               |

### 7.3.6 Object 6031<sub>h</sub>: Battery ID

This object shall provide a character string (numeric or alpha-numeric) associated with a battery pack that uniquely identifies it to the owner. The battery ID may not be unique across the entire population of batteries. Maximum number of characters shall be 20.

#### VALUE DEFINITION

Character strings in the battery module shall be packed into Unsigned32 objects to allow them to be transferred using expedited SDO services. For an example of the packing, refer to object 6030<sub>h</sub>.

#### OBJECT DESCRIPTION

|             |                   |
|-------------|-------------------|
| Index       | 6031 <sub>h</sub> |
| Name        | battery ID        |
| Object code | ARRAY             |

| Sub-index      | 05 <sub>h</sub>                  |
| Description    | packed ASCII characters 17 to 20 |
| Entry category | Optional                         |
| Access         | ro                               |
| PDO mapping    | No                               |
| Value range    | Unsigned32                       |
| Default value  | No                               |

### 7.3.7 Object 6040<sub>h</sub>: Vehicle serial number

This object shall provide a character string (numeric or alpha-numeric) associated with a vehicle, usually applied by the manufacturer. The vehicle serial number may not be unique across the entire population of vehicles. Maximum number of characters shall be 20.

#### VALUE DEFINITION

Character strings in the battery module shall be packed into Unsigned32 objects to allow them to be transferred using expedited SDO services. For an example of the packing, refer to object 6030<sub>h</sub>.

#### OBJECT DESCRIPTION

|             |                       |
|-------------|-----------------------|
| Index       | 6040 <sub>h</sub>     |
| Name        | vehicle serial number |
| Object code | ARRAY                 |
| Data type   | Unsigned32            |
| Category    | Optional              |

#### ENTRY DESCRIPTION

to

|                |                                  |
|----------------|----------------------------------|
| Sub-index      | 05 <sub>h</sub>                  |
| Description    | packed ASCII characters 17 to 20 |
| Entry category | Optional                         |
| Access         | ro                               |
| PDO mapping    | No                               |
| Value range    | Unsigned32                       |
| Default value  | No                               |

### 7.3.8 Object 6041<sub>h</sub>: Vehicle ID

This object shall provide a character string (numeric or alpha-numeric) associated with a vehicle that uniquely identifies it to the owner. The vehicle ID may be a manufacturer's serial number or an asset number applied by the owner. The vehicle ID number may not be unique across the entire population of vehicles. Maximum number of characters shall be 20.

#### VALUE DEFINITION

Character strings in the battery module shall be packed into Unsigned32 objects to allow them to be transferred using expedited SDO services. For an example of the packing, refer to object 6030<sub>h</sub>.

#### OBJECT DESCRIPTION

**7.3.9 Object 6050<sub>h</sub>: Cumulative total Ah charge**

This object shall provide the cumulative number of Ampere-hours delivered to the battery by the charger over the life of the battery. This shall be a read-only value in order to protect the integrity of the data. The battery module logic may use the Ah delivered value to internally increment the cumulative value.

**VALUE DEFINITION**

The resolution shall be 1 Ah per bit.

**OBJECT DESCRIPTION**

|             |                            |

| Value range   | Unsigned32      |
| Default value | No              |

**7.3.10 Object 6051<sub>h</sub>: Ah expended since last charge**

This object shall provide the number of Ampere-hours discharged from the battery pack since the last charge event. This value may represent a net energy output if the vehicle is equipped with regenerative braking.

**VALUE DEFINITION**

The resolution shall be 0.125 Ah per bit.

**OBJECT DESCRIPTION**

|             |                               |

| Default value | No              |

**7.3.11 Object 6052<sub>h</sub>: Ah returned during last charge**

This object shall indicate the number of Ampere-hours delivered to the battery by the charger during the last charge event. This is a read-write message to allow the charger to read the previous value and write the current value at the completion of charge.

**VALUE DEFINITION**

The resolution shall be 0.125 Ah per bit.

**OBJECT DESCRIPTION**

**7.3.12 Object 6053<sub>h</sub>: Ah since last equalization**

This object shall indicate the cumulative number of Ampere-hours delivered to the battery by the charger – over the course of several charge events – since the last equalization charge.

**VALUE DEFINITION**

The resolution shall be 0.125 Ah per bit.

**OBJECT DESCRIPTION**

|             |                            |

|               |                               |
|---------------|-------------------------------|
| Sub-Index     | 00 <sub>h</sub>               |
| Access        | ro                            |
| PDO mapping   | Default if TPDO2 is supported |
| Value range   | Unsigned32                    |
| Default value | No                            |

**7.3.15 Object 6070<sub>h</sub>: Charge current requested**

This object shall provide the electrical current in Amperes requested by the battery module to be delivered by the charger to the battery.

**VALUE DEFINITION**

The resolution shall be 1/16 A per bit. FF<sub>h</sub> shall indicate an invalid value.

**OBJECT DESCRIPTION**

|             |                                  |
|-------------|----------------------------------|
| INDEX       | 6070 <sub>h</sub>                |
| Name        | charge current requested         |
| Object code | VAR                              |
| Data type   | Unsigned16                       |
| Category    | Mandatory: if TPDO3 is supported |

**ENTRY DESCRIPTION**

|               |                               |
|---------------|-------------------------------|

| Access        | ro                            |
| PDO mapping   | Default if TPDO3 is supported |
| Value range   | Unsigned16                    |
| Default value | No                            |

**7.3.16 Object 6080<sub>h</sub>: Charger state of charge**

This object shall indicate the charger's estimation of the amount of energy contained in the battery, expressed as a percentage of the total amount of energy the battery can store.

**VALUE DEFINITION**

Resolution shall be 1 % per bit. FF<sub>h</sub> shall indicate an invalid value.

#### OBJECT DESCRIPTION

|             |                                    |

| INDEX       | 6080 <sub>h</sub>                  |
| Name        | charger state of charge            |
| Object code | VAR                                |
| Data type   | Unsigned8                          |
| Category    | Mandatory: if RPDO2/3 is supported |

#### ENTRY DESCRIPTION

|               |  |
|---------------|--|
| Sub-index     | 00 <sub>h</sub>  |
| Access        | rw   |
| PDO mapping   | Default if RPDO2/3 is supported                        |
| Value range   | 00 <sub>h</sub> to 64 <sub>h</sub> and FF <sub>h</sub> |
| Default value | FF <sub>h</sub>  |

#### 7.3.17 Object 6081<sub>h</sub>: Battery state of charge

This object shall provide the battery's measurement of the amount of energy contained in the battery, expressed as a percentage of the total amount of energy the battery can store.

#### VALUE DEFINITION

Resolution shall be 1 % per bit.

#### OBJECT DESCRIPTION

|             |                                  |
|-------------|----------------------------------|
| INDEX       | 6081 <sub>h</sub>                |
| Name        | battery state of charge          |
| Object code | VAR                              |
| Data type   | Unsigned8                        |
| Category    | Mandatory: if TPDO3 is supported |

#### ENTRY DESCRIPTION

|               |  |
|---------------|--|
| Sub-index     | 00 <sub>h</sub>  |
| Access        | ro   |
| PDO mapping   | Default if TPDO3 is supported                          |
| Value range   | 00 <sub>h</sub> to 64 <sub>h</sub> and FF <sub>h</sub> |
| Default value | No   |

### 7.3.18 Object 6090<sub>h</sub>: Water level status

This object shall indicate the need for additional water in a flooded battery-i.e., full or low.

#### VALUE DEFINITION

The status byte shall have the following format:

|     |                     |              |
|-----|---------------------|--------------|
| 7   | 1                   | 0            |
|     | <i>Reserved (0)</i> | <i>Bit 0</i> |
| MSB |                     | LSB          |

*Bit 0*: 0 = low

1 = full

#### OBJECT DESCRIPTION

|             |                    |
|-------------|--------------------|
| INDEX       | 6090 <sub>h</sub>  |
| Name        | water level status |
| Object code | VAR                |
| Data type   | Unsigned8          |
| Category    | Optional           |

#### ENTRY DESCRIPTION

|               |                      |
|---------------|----------------------|
| Sub-index     | 00 <sub>h</sub>      |
| Access        | ro                   |
| PDO mapping   | No                   |
| Value range   | See value definition |
| Default value | No                   |

## Appendix A (normative): Battery type parameter

The battery type parameter (object 6020<sub>h</sub> sub-index 1) shall be given in following format:

cccc        wxyz

where cccc gives the chemistry, and wxyz describes the sub-types.

### A.1 Lead acid (PbA)

cccc        0001

w            0 for flooded  
              1 for maintenance free

#### A.1.1 Flooded

x            reserved  
y            0 for normal  
              1 for high gravity  
z            0 for flat plates  
              1 for tubular

#### A.1.2 Maintenance free

x            reserved  
yz          00 for AGM  
              01 for gel  
              10 for hybrid  
              11 not used

eg. flooded, normal gravity, flat plate PbA: 00010000

### A.2 Nickel cadmium

cccc        0010

w            0 for vented  
              1 for sealed

x            reserved  
y            reserved  
z            0 for pocket plate  
              1 for sintered plate

### A.3 Nickel zinc (NiZn)

cccc        0011

wxyz        reserved

**A.4 Nickel iron (NiFe)**

cccc      0101  
wxyz      reserved

**A.5 Silver oxide**

cccc      0110  
wx        reserved  
yz        00 for AgZn  
          01 for AgCd  
          10 for AgFe  
          11 not used

**A.6 Nickel hydrogen (NiH2)**

cccc      0111  
wxyz      reserved

**A.7 Nickel metal hydride (NiMH)**

cccc      1000  
wxyz      reserved

**A.8 Zinc/Alkaline/Manganese dioxide**

cccc      1001  
wxyz      reserved

**A.9 Lithium ion (LiI)**

cccc      1010  
wxyz      reserved

**A.10 Zinc bromine**

cccc      1011  
wxyz      reserved

**A.11 Metal air**

cccc      1100  
wxyz      reserved

**A.12 Lithium/Iron sulfide**

cccc 1101

wxyz reserved

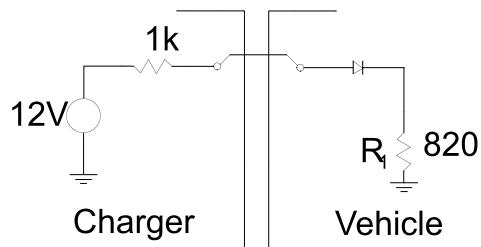

**A.13 Sodium beta**

cccc 1110

wxyz reserved

**Appendix B (normative): Pilot signal**

The *figure 1* shows a schematic of the pilot circuit, which may be used to allow the charger and battery module to detect each other's presence without any of the latency involved in checking that a communication link is active. Its main purpose is to allow the charger to quickly reduce its output current when the connection to the battery is lost in order to limit arcing between the connector contacts.

**Figure 1: Connection between charger and vehicle battery**

### Appendix C (informative): Overview on application objects

Battery module specific mandatory and optional application objects are listed in:

**Table 3: Overview on application objects**

| Index             | Object code | Name                           | Data type                     | Access | Category       |
|-------------------|-------------|--------------------------------|-------------------------------|--------|----------------|
| 6000 <sub>h</sub> | VAR         | Battery status                 | Unsigned8                     | ro     | M              |
